ANNEX · 11 SEPTEMBER 2026

This annex is the companion to the 11 September 2026 edition and is built every day. The edition is capped at eight pages; material is RELOCATED here, never deleted. Section numbering tracks the edition: **A1** carries the full commentary for the live-tape tables and the gasoline chart, the full strait-operational record and the freight and war-risk record; **A2.3** the full cross-asset and macro record and the SPR withdrawal; **A7** the source log; **A8** the on-demand update protocol; **A9** the methodology; **A10** the anchor and trigger levels. **A figure marked NOT OBTAINED — or, equivalently, NOT FOUND — was sought and missed, and is absent from the record rather than unchanged. A figure marked PROSPECTIVE relates to a session or publication that had not occurred at the Singapore cut and is not a retrieval failure (§9.46).**

A1 · LIVE TAPE — FULL COMMENTARY

A1.1 · Data integrity — §9.8 and §9.41 CLEAR, §9.35 FIRES on one field, §9.60 did NOT repair

The extract holds **181 data rows across 99 columns**, from 31 December 2025 to 11 September 2026 — one row longer than the last. Column positions are resolved by header scan every edition and never hardcoded (§3, §9.4); Brent and WTI resolve to **CO2 Comdty** and **CL2 Comdty**, with the active contracts at **COA** and **CLA**. **§9.8, the row-level test, CLEARS.** Eighteen fields moved on the 10 September row against the 9th, so no stale-snapshot condition exists and the d/d deltas are sound. (!) **§9.35, the field-level identical-to-4dp test**, FIRES on ONE field and it is SOFR. The 9 September SOFR cell was BLANK in the last extract and has backfilled to 3.64, identical to the 8th at four decimals. The honest reading is given both ways: an overnight benchmark administered around a policy corridor repeats routinely, and this is the field on which a repeat carries least information — but the test is mechanical and does not know that, so it is reported as fired, and the value is treated as PROVISIONAL. **No conclusion, no channel and no trigger distance in this edition rests on SOFR.** The test clears on every other field of the 8th, 9th, 10th and 11th, which matters because five tenors set war-high closes on the 10th and every one of them rests on a demonstrably fresh value — the exact failure mode §9.35 was written for after a carried 30-year concealed a war high on 17 August. **§9.41, the continuation-versus-active basis check, CLEARS.** The Brent basis reads 4.11, 4.91, 5.17 across 9–11 September and the WTI basis 3.18, 4.08, 4.28: both widened, both smoothly, neither changed sign and neither stepped. There is no roll in this window, and the Brent roll of 31 August remains the live discontinuity that no comparison here crosses. (!) **§9.60 DID NOT REPAIR, in a FOURTH consecutive extract.** WTI CL2, CLA and Henry Hub are still blank on the 7 September row. Those three cells were published as 7 September marks in an earlier extract and have never settled; they are recorded as LOST, not as unchanged, and no 7 September figure for them appears anywhere in this edition.

A1.2 · Reconciliation of the 10 September snapshot — the most one-directional of the war

FIFTEEN marks were published for 10 September and ALL FIFTEEN reconcile — no field was published UNRESOLVED under §9.35 last edition, so §9.37 excludes nothing this time. **FOURTEEN of the fifteen settled ABOVE their marks and ONE below.** Energy: Brent +$5.72, COA +$6.44, WTI +$5.39, CLA +$6.01, Henry Hub +$0.039, TTF +€3.027. Rates: 2-year +15.57 bp, 5-year +14.36, 10-year +11.99, 20-year +9.81, 30-year +7.31, breakeven +3.16, forward +1.77. Dollar +0.232. **The 2s10s alone settled below its mark**, at –3.575 bp — and that is not an inconsistency, because USYC2Y10 is a separately published index that does NOT equal the ten-year less the two-year on any row of this extract (§9.69): 37.70 computed against 37.496 printed. (!) **The Brent miss of +$5.72 is the largest this table has recorded**, and it is the THIRD consecutive one-directional upside miss — +$1.06 on 8 September, +$1.49 on 9 September, +$5.72 on the 10th. **The pattern is now documented rather than anecdotal.** The Singapore cut is taken before the US session, and in a rising tape it systematically understates the settle; on 10 September it understated it by more than the entire distance from the 9 September close to the $95 trigger. (!) **This is exactly why the oil channel was NOT fired on the 10 September mark**, and it is also why the inference cuts only one way: a systematic understatement is a reason to distrust marks, not a licence to extrapolate them (§9.31). The only place this inference is allowed to bear on anything is the scenario map, where it moves no score.

A1.3 · Energy and gas — full commentary

Brent, the scored continuation. Closed $102.72, up $5.62, $7.72 through the **$95** upgrade and +41.72% on the **$72.48** pre-war anchor. On the week it is +$11.09 against the 3 September close, the five-row base. The session traded $96.14 to $104.62, an $8.48 range, and the low never returned to the trigger. (!) **It is NOT a war high**: $118.35 on 31 March stands, and $102.72 is the highest close since 22 May. The one-day rise is the **eleventh** largest of the war — ten war sessions produced bigger ones, the largest being $8.48 on 12 March — so it is a big move and NOT a record, and it is described that way. **Brent, the active contract.** Closed $107.63, up $6.42, a **SEVENTH** consecutive close through **$95** and the highest since 4 May; +51.85% on its own $70.88 anchor. (!) Its +$6.42 IS the second-largest one-day rise of the war on that series, behind $6.68 on 13 July. (!) **THE WIRE TAPE QUOTES THE ACTIVE CONTRACTS.** Settlement figures of $107.63 for Brent and $102.48 for WTI are circulating widely; they match COA and CLA exactly and differ from the scored pair by $4.91 and $4.08. **They are not a contradiction of the scored series and are never merged with it** (§9.36b, §9.41). **WTI.** CL2 $98.40, up $5.53, the highest close since 19 May; CLA $102.48, up $6.43. No trigger is written on WTI. **Henry Hub.** Closed $2.834, up $0.012, at 7.48% below its $3.063 anchor — narrower than the 7.87% of 9 September, so no superlative. **It remains the only ENERGY series below its pre-war anchor** while the two internationally traded gas benchmarks set records, and that divergence is the load-bearing EVIDENCE — not proof — for a routing and loading shock rather than a global supply shock; the TTF leg is partly non-Hormuz. **TTF.** Closed €82.047, up €2.801, the **SEVENTEENTH** war-record close and the first above €82, +162.7% on its €31.227 anchor — the largest multiple on this tape. The 11 September mark of €82.055 is higher again but is a mark. **Asia LNG.** Closed ¥4,198, up 83, the **FOURTEENTH** war-record close, +151.5% on its ¥1,669 anchor. It does not print on the 11 September row and is shown as no print, not as unchanged.

A1.3a · US Treasuries — full commentary

All five tenors closed at new war highs on 10 September, and the one-day changes fall monotonically with tenor: **2-year +15.61, 5-year +14.55**, 10-year +12.20, 20-year +10.07, 30-year +7.63 bp. That is a clean bear flattener; the 2s10s fell 3.195 to 37.496, 18.14 bp below its 55.64 anchor. (!) **The 2-year's 15.61 bp is the largest one-day rise at that tenor in the entire war**, past 13.27 on 17 June. The 10-year's 12.20 is the second largest at its tenor, behind 13.03 on 20 March. The 30-year's 7.63 is NOT a superlative — 11.21 bp on 29 July is larger — and the fact that the long end moved least on the day every tenor made a high is the whole of the policy reading. Levels: **2-year 4.5856%** (+121.07 bp on anchor), **5-year 4.7618%** (+126.01), **10-year 4.9626%** (+102.51), **20-year 5.3915%** (+84.10, past 5.3016 of 17 August), **30-year 5.3652%** (+75.46, past 5.3060 of 17 August). (!) **The 20- and 30-year highs are the ones that supersede last edition's migration reading**, and they did it after seventeen sessions rather than never. **Inflation compensation.** BE10 closed 2.4165%, +2.86 bp, its highest since 21 May and 15.96 bp above its 2.2569% anchor; it carried 2.86 of the ten-year's 12.20, so under a quarter of the move was compensation and the rest was real rate. The 5y5y forward closed 2.3295%, +1.29 bp, a **SEVENTH** consecutive close above the 2.30% firing level, clearing by 2.95 bp — the widest of the run, against a previous widest of 1.66 — and the highest close since 20 August. It is 18.75 bp above the 2.142% downgrade anchor, from 17.46. (!) The seven clearances read 1.10, 0.96, 1.54, 0.82, 1.19, 1.66, 2.95 bp: **not monotone**, and the latest is nearly double its predecessor, so it is a jump rather than a trend.

A1.4 · Strait operational — the full record, every provider, every denominator

Provider	Reading and date	Denominator — what is actually counted
Kpler	10 vessels/day on a 10-day mean, at 9 Sep; its own lowest since May	Commodity vessels EXCLUDING naval auxiliaries, offshore support, tugs, coastal and small craft. Its own pre-war base is above 130/day, so this is under 8%. (!) The only provider with a clean run, so it is the trend indicator (§9.24)
UKMTO	59 ships in 48 hours to 9 Sep 0500 ET (about 29.5/day)	(!) A REPORTING universe — ships that reported to UKMTO — and NOT a transit count. It is the largest number on this table and the least comparable; it is never used as a numerator
Windward	16 transits, 8 Sep — 10 inbound, 6 outbound; 2 dark of 16	Mixed tanker, bulk and cargo; no dwt threshold published. Directional, which no other provider publishes
Lloyd's List Intelligence	~12/day, 26 Aug–1 Sep — now more than a week stale	Cargo-carrying vessels OVER 10,000 dwt only. The narrowest tonnage screen on this table
straits.live	Single digits on 10 Sep against 12 on the 9th	(!) **Provider UNATTRIBUTED and flagged PRELIMINARY by its own publisher.** Recorded so the record is complete; it is NOT scored and NOT used in any percentage
JMIC / US NCAGS	No new facilitated-transit figure in Update 095	US NCAGS facilitated transits plus S&P Maritime and SeaVision cargo vessels over 1,000 dwt, excluding vessels calling Iranian ports; baseline ~138/day (2025). (!) A FACILITATED SUBSET, and the last figure is now stale
Blockade tally	100+ redirected since April, 4 disabled, 26 humanitarian permitted; 9 Sep. Queue 42 tankers at 7 Sep, 18 with ~11.1 mn bbl	(!) Cumulative redirections, NOT a rate. **4 disabled here against 5 destroyed claimed for 8 September alone**: different measures on different bases, never summed

(!) **THE BASELINE REMAINS DISPUTED AND NO PERCENTAGE OF NORMAL IS QUOTED WITHOUT ONE.** In circulation: 85/day (PortWatch), 100/day, **130–140**/day (Kpler pre-war) and 138/day (JMIC 2025). The maritime downgrade test in §2.1 is therefore run solely where ONE provider supplies BOTH numerator and baseline (§9.19, §9.24), which this week means Kpler alone: **10 against 130-plus, under 8%**, against a 25% threshold. **Retrieval, stated exactly.** (!) **JMIC Update 095 IS OBTAINED**, read directly from ukmto.org, closing a negative carried for three editions; the correction of the address — jmic.online is an unrelated academic journal and is struck permanently — is what found it. **096 is NOT YET PUBLISHED**: a constructed URL on the confirmed 095 filename pattern returns 404. On the only cadence on the record — 094 cut at 051500Z and 095 at 101500Z, five days apart — the next product is due around 15 September, and this document does not predict it more precisely than that. (!) **No claim is made that 096 does not exist** — a 404 against a constructed URL is the evidence class that failed this document on 8 September (§9.64). UKMTO's own incident and advisory indexes remain JavaScript shells that render empty to a fetcher and are **NOT OBTAINED**, so the 128-26 to 132-26 references in this edition reach the record through JMIC 095 rather than through UKMTO directly.

A1.4a · Primary text — the statements the judgment rests on, verbatim

Source and date	Text, as published	How it is used
JMIC Update 095, ICOD 101500Z, 10 Sep	'Total of 109 incidents since 01 March; 7 incidents since the last report.'	(!) **Published verbatim and NOT adjusted.** Update 094 gave 101 and NIL; 101 plus 7 is 108. The discrepancy is JMIC's, is reported as JMIC's, and is left for 096 to settle
JMIC Update 095, 10 Sep	Mariners are advised to remain vigilant for 'attempted mining activity within and adjacent to the TSS'.	Compared word for word with 094's 'mining activity in the area'. Narrower in geography, different in tense, and it does NOT say the mines are gone
JMIC Update 095, 10 Sep	Hormuz SEVERE. Bab el-Mandeb and the Gulf of Aden SUBSTANTIAL. Arabian Gulf, Gulf of Oman, Arabian Sea MODERATE. Traffic 'expected to remain at reduced levels, compared to the 2025 baseline'.	The threat-level ladder is unchanged at Hormuz. (!) The SUBSTANTIAL rating on Bab el-Mandeb predates the Mokha seizure and is NOT evidence about it
JMIC Update 095, incidents 128-26 to 132-26	HORIZON 1 (LPG, 3,177 MT aboard), 08 Sep, projectile to the stern, fire, crew evacuated. DERYA, KAVIZ, CHARMINAR, RIESCO, 08 Sep, 'disabled by U.S. forces'; RIESCO subsequently sank. HERCULES STAR, 09 Sep, listing, one fatality and one missing. NEW ANDROS, 09 Sep, struck by a projectile. GLAMOR, 10 Sep, cargo ship boarded by unauthorised personnel.	(!) **This CORROBORATES CENTCOM's 8 September claim**, which named the same five vessels. (!) Attribution to US forces covers the FOUR 129-26 vessels only; 128-26 HORIZON 1 carries none. (!) The A/B/C/D are NATO phonetic SUB-REFERENCES, NOT parts of the vessel names
CENTCOM, 8 Sep	Five IRGC tankers 'struck and destroyed'; crews directed to abandon ship before the vessels were struck and rendered inoperable.	(!) **One divergence survives corroboration**: CENTCOM says destroyed, JMIC says disabled, and only RIESCO is recorded as having sunk. Both are published; neither is reconciled
Al Jazeera / Reuters, 10 Sep	Houthi forces seized Mocha; Reuters cites three Yemeni government sources. Bab el-Mandeb is about 29 km at its narrowest; an analyst quoted says it could be controlled 'just with artillery'. Yemen's presidential council head: it 'cannot become another Strait of Hormuz'.	The proximate driver of the 10 September oil session. (!) The Houthi spokesman says navigation 'remain safe and uninterrupted' WHILE the ban on Saudi ships stands; both halves are recorded
Saudi Arabia to OPEC, reported 10 Sep	August crude output 6.238 mb/d, the lowest since 1990, down about 1.9 mb/d on the month.	The producer's OWN direct submission, which is why it is treated as realised degradation rather than an estimate

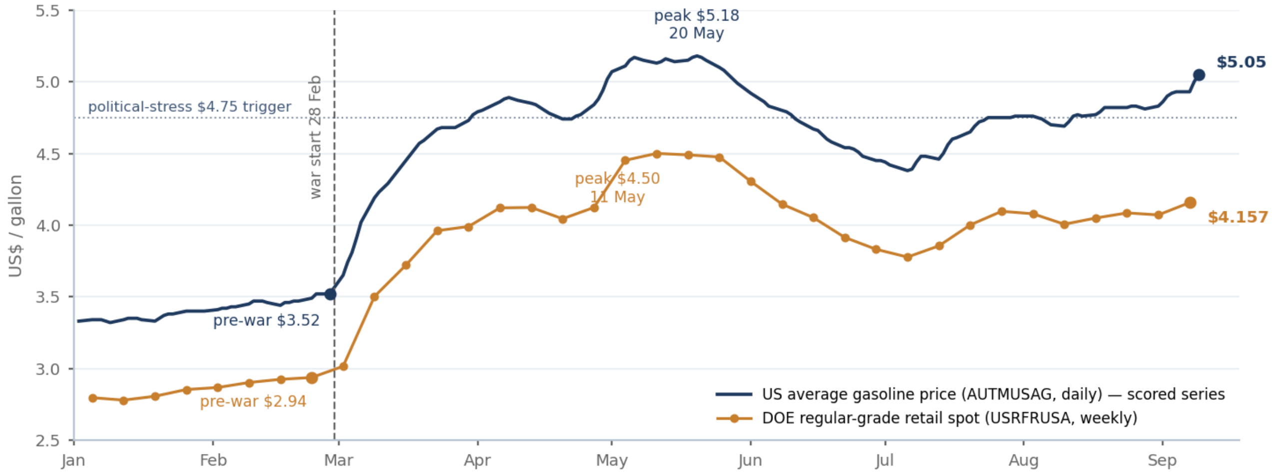
A1.5 · Retail fuel — FIVE series, never SPLICED

Series	Latest	Basis	Standing
AUTMUSAG — SCORED	$5.05, 9 Sep	AAA all-grades retail pump, daily, one-day lag, Bloomberg	The only series the political channel scores. (!) Highest since 27 May, when it last printed exactly $5.05 — it MATCHES rather than exceeds. 13c below the $5.18 peak of 20 May. (!) The series DESCRIPTION remains WITHDRAWN (§9.57)
USRFRUSA	$4.157, 7 Sep	DOE regular-grade retail spot, WEEKLY, Mondays	Corroboration only. Unchanged this edition; next print 14 September, so the §9.57 spread is UNTESTED rather than stable
AAA regular	$4.2770, 10 Sep	AAA national average, regular grade	+13.3c on the week. Still 14.7% below its own all-time record of $5.0165 set 14 June 2022. (!) Same-date gap to AUTMUSAG NARROWED to 82.6c on 9 Sep, from 84.9c on the 8th
AAA diesel	$5.9773, 10 Sep	AAA national average, diesel	(!) **A SECOND consecutive all-time record**, +3.49c on the $5.9424 of 9 September, and **2.27 cents short of $6.00**
GasBuddy diesel	Above $6.00, 10 Sep	GasBuddy national average, diesel — a DIFFERENT panel	(!) **Crossed six dollars for the first time on record on 10 September.** A six-dollar headline is true of THIS series and not of AAA's, and the two are never spliced (§9.19)

(!) **§9.57 is UNTESTED this edition**, which is not the same as stable. The AUTMUSAG-to-DOE spread requires both series to resolve on the same date; the DOE series is weekly and last resolved on 7 September at a record **77.3 cents**, the ninth consecutive widening across ten observations. Recomputed on the SAME window the last edition used — the 36 dates since 5 January on which both resolved — the spread means **64.7 cents** and ranges 51.6 (16 February) to 77.3 (7 September), unchanged from last edition because no new observation exists. The next test is 14 September. **§9.61 stands**: AUTMUSAG is a GASOLINE series measuring gasoline correctly, and whether a distillate record belongs in a channel scored on gasoline is a SCOPE question left open rather than settled. (!) **What changed the weight of that question is the producer data**: August PPI put diesel at +24.1% on the month, more than a third of the entire final-demand goods increase. The channel this document scores on gasoline is, on the official statistics, being driven by the fuel it does not watch.

A1.5a · US retail fuel chart — relocated from §1.6

AUTMUSAG (scored, navy) and USRFRUSA (weekly, amber) from 1 January 2026, with the **$4.75** level that fired the political channel 4→5 on 4 August shown dotted.



(!) Navy ends 9 September at $5.05; amber ends 7 September at $4.157. Neither is extrapolated to 10 or 11 September. (!) **Neither line is AAA regular**, neither is AAA diesel and neither is GasBuddy — the series that crossed six dollars on 10 September appears on none of them.

A1.6 · Freight, war risk and ports

Baltic TD3C (VLCC, Middle East Gulf to China). Last assessment obtained is WS677.22 with a round-trip TCE near **$704,000/day**, assessed **3 September** and published in the week-36 report of 4 September, against WS631.67 on 28 August. (!) **The current week is NOT FOUND** — the week-37 page returns 404 and no syndicated roundup is indexed — so the figure is published WITH ITS DATE and is not presented as a current level. (!) Separately, a headline 'VLCC index tops $420K' refers to the Baltic VLCC INDEX average, a different series from the TD3C round-trip TCE, and the two are not combined. **War risk.** Cover for a Gulf transit is quoted at **7.5–12.5% of hull value** against about 0.25% before the conflict, dated 8 September — a thirty- to fifty-fold rise. (!) A separate figure in circulation, about **$10 million per VLCC voyage** with several P and I clubs withdrawing cover, is on a DIFFERENT basis — absolute dollars rather than a percentage of hull — and the two are reported side by side and never combined. **Regional flows.** Basrah crude exports are reported to have recovered from about 1.35 mb/d in July to about 2.35 mb/d in August, still below pre-war. (!) **The SPR level for the week ended 4 September is NOT FOUND** and **286.6 mn bbl** for the week ended 28 August — reported as the lowest since December 1982 — is NOT carried forward as a current figure (§9.19).

A2.3 · CROSS-ASSET AND MACRO RECORD — FULL

A2.3.1 · One trading session, and the war high stopped migrating

The 10 September session did in one day what sixteen trading sessions since 17 August had not — seventeen rows, one of them the shut Labor Day market that wrote no close (§9.58): it took every tenor of the US curve to a new war-high close. **2-year 4.5856%, 5-year 4.7618%**, 10-year 4.9626%, 20-year 5.3915%, 30-year 5.3652%. The 20- and 30-year highs are the material ones, because the 10 September edition built a structural reading on their ABSENCE — that the war high had migrated down the curve and that the long end had stopped leading. (!) **That reading is SUPERSEDED after one session and is named here rather than quietly dropped**, which is the rule this document applies to its own conclusions (§9.65). What survives it is the SHAPE. The changes fall monotonically with tenor — +15.61, +14.55, +12.20, +10.07, +7.63 bp — so the long end still moved LEAST on the day it made a high, and the 2s10s flattened 3.195 bp to 37.496. A front-led selloff is a policy selloff. The migration reading was an attempt to say that in levels; levels have now caught up, and the shape says it better. (!) The 2-year's 15.61 bp is the largest one-day rise at that tenor in the entire war, past 13.27 bp on 17 June — and 17 June was itself a policy event.

A2.3.2 · The data calendar — what landed, what has not, and the difference

Release	Date and time	Result, or why there is none
August PPI	10 Sep, 08:30 ET	**LANDED and it is the proximate cause of the selloff.** Final demand +0.4% m/m and +5.4% y/y, the highest annual rate of 2026, from +4.8%. Core (ex food, energy, trade) +0.3% m/m, +4.7% y/y. Final-demand energy +4.2% m/m, more than three-quarters of the goods increase; **diesel +24.1% m/m**, over a third of the final-demand goods rise on its own
Initial jobless claims	10 Sep, 08:30 ET	206,000 for the week ended 5 September, down 1,000 on a revised 207,000; four-week average 206,000; continuing claims 1,774,000 for the week ended 29 August; insured unemployment rate 1.2%. Policy-neutral, and the only release this week that did not push the curve
$22bn 30-year reopening	10 Sep, 13:00 ET	**LANDED. Stop 5.308% against a 5.335% when-issued**— a 2.7 bp stop THROUGH. Bid-to-cover 2.612; indirects 79.5%; directs 18.3%; primary dealers 2.21%. Highest 30-year stop since August 2001 and the fifth consecutive above 5%. (!) The when-issued level is a dealer-desk figure, TIER 2 (§9.39)
EIA Weekly Petroleum Status Report	10 Sep, 12:00 ET	**LANDED after two delayed cycles.** Week ended 4 September: commercial crude **424.1 mn bbl**, –0.4 mn, at the five-year average; **crude imports 6.8 mb/d, +53,000 b/d**, four-week average 2.3% above a year earlier; refinery utilisation 97.8%; gasoline +1.3 mn bbl, about 5% below the five-year average; distillate +2.1 mn bbl, about 13% below
OPEC MOMR	10 Sep	**RETRIEVED this edition**, after the last edition could not retrieve it at all. 2026 demand growth cut to +380,000 b/d, a FIFTH consecutive monthly downgrade. (!) OPEC-wide production figures and any Hormuz-specific language were NOT FOUND in the September report
August CPI	11 Sep, 08:30 ET	(!) **PROSPECTIVE at the Singapore cut**— it has not been published, which is NOT a retrieval failure (§9.46). Consensus +0.4% m/m and 3.4% y/y headline, core 2.4% y/y. (!) The core MONTHLY consensus is quoted at +0.4% by one dated source and +0.2% by another; the two are NOT averaged. It is the last inflation reading before the FOMC
IEA Oil Market Report	11 Sep, 10:00 Paris	(!) **PROSPECTIVE.** The IEA data-product page lists August 2026 as latest and schedules September for 11 September; the September URL returns 404 at the cut
SPR level, week ended 4 Sep	—	(!) **NOT FOUND.** The weekly summary served a stale edition and the SPR series page returned 2020 data. **286.6 mn bbl** for the week ended 28 August is NOT carried forward (§9.19)

A2.3.3 · Fed pricing — and the withdrawal of a spliced comparison

(!) **WITHDRAWN: the hike-odds comparison published in the 10 September edition.** That edition wrote that the market was priced near 56% for a 25 bp hike on 16 September, 'down from about 66% on 31 August'. **The two numbers are from DIFFERENT VENUES.** The 66% is CME FedWatch; the 56% is a prediction-market price, and this document itself sourced a 56.5% prediction-market figure on 2 September when it discharged §9.50. **Differencing two venues into one series is exactly what §9.19 forbids**, and the comparison is withdrawn on that ground alone. (!) **What is NOT claimed is that the direction was wrong.** Read on ONE venue, CME FedWatch runs 44% a month before 9 September, 66% on 31 August, 62% on 9 September, and higher again after the PPI on the 10th: **up over the month, modestly DOWN across the fortnight the withdrawn sentence actually spanned.** The defect is a spliced series and an unstated venue, not an inverted sign, and saying otherwise would be a second error laid on the first. From this edition the venues are published separately and never differenced across: **CME FedWatch 62% (9 September)**; **prediction market 54% (11 September)**. (!) A post-PPI CME reading in the 65–70% range is reported by three dated sources on 10 September; **they do not agree with each other to the point**, so no single post-PPI figure is asserted and the 9 September value is the one carried. The FOMC meets **15–16 September** on a target range of 3.50–3.75%, unchanged since December 2025, and is in blackout — (!) which is why **NO Fed speaker appears in this window**, and that absence is a calendar fact rather than a retrieval failure.

A2.3.4 · Treasury supply — the long end is absorbed at a record-low dealer take

The $22bn 30-year reopening of 10 September is the most informative auction of the war so far, and it points AWAY from the fiscal reading. It stopped at 5.308% against a 5.335% when-issued at the 13:00 bid deadline: a **2.7 bp stop THROUGH**, described by the desks as the second-largest stop-through on record, against a recent six-auction average tail near zero. Bid-to-cover 2.612, the highest since February, against a 2.38 average. Indirects 79.5%, reported as the second-highest on record. Directs 18.3%. **Primary dealers 2.21%, the lowest on record by a wide margin**, against 11.51% at the 13 August new issue. (!) **§9.39 IS NOT RELAXED.** Treasury publishes no when-issued level, so the 5.335% is a dealer-desk figure and the stop-through is reported at TIER 2. The point stands at that tier and does not need a higher one: **a 2.7 bp stop-through and a 2.21% dealer take are not the signature of a buyer strike.** Across one month the dealer backstop has HALVED at the ten-year — 8.6% on 12 August to 4.31% on 9 September — and fallen by more than four-fifths at the thirty. (!) **Comparability, stated:** this is a REOPENING at $22bn and the 13 August auction was a NEW ISSUE at **$25bn** that cleared 5.216%; the yields are comparable as market levels but the concessions are not, and no tail comparison is made across them. (!) One secondary source renders the August stop as 5.212%; four others give 5.216% and **5.216% is used**, with the discrepancy recorded rather than hidden. At 5.308% this is the highest 30-year auction yield since August 2001 and the fifth consecutive above 5%. Separately, a Treasury buyback programme in the 10–20 year sector was on the tape at $6bn and was judged by commentary to be small against the inflation and deficit concerns — (!) reported as commentary, not as a finding.

A2.3.5 · The physical balance — a test RESOLVED and a producer at a 36-year low

(!) **§9.28’S IMPORT-REVERSION TEST IS RESOLVED**, AFTER TWO CYCLES UNRESOLVED, AND IT RESOLVES TO NO REVERSION. The test asked whether US crude imports would hold near the 7.3 mb/d they surged to, or revert toward the 6.3 that preceded it. For the week ended 4 September they printed 6.8 mb/d, up 53,000 b/d, after 6.8 the prior week, with the four-week average 2.3% above the same period a year earlier. **They did neither: they settled in between and edged higher.** The reading is that the routing shift is now two cycles old and is structural rather than a one-week artefact — the US is importing MORE crude, not less, while the shock is a supply-routing shock. Distillate stocks, at about 13% below their five-year average, are the inventory counterpart of the diesel record and of the +24.1% monthly diesel move in the producer data. **Supply, on the other side.** Saudi Arabia reported to OPEC that its August crude output was **6.238 mb/d, the lowest since 1990**, down about 1.9 mb/d on the month — the producer’s own direct submission, which is why this document treats it as realised rather than estimated. The EIA’s 9 September STEO put crude shut-ins at 6.7 mb/d in August, from 5.0 in July, with 5.7 forecast for Q4 and a Brent forecast near $90 for 2H26 — (!) a forecast completed on 3 September and already $12.72 below the scored 10 September close, which is recorded as a measure of how fast the tape moved rather than as a criticism of the forecast. (!) **The 0.07 mb/d effective OPEC spare-capacity figure remains RETIRED** and is not revived by anything in this window.

A2.3.6 · The regional widening — and what is deliberately NOT asserted

Mokha, 10 September. Houthi forces took the Red Sea port city; government forces withdrew south. Reuters cites three Yemeni government sources; Al Jazeera had a correspondent on the ground; UPI, Euronews, The National and Foreign Policy corroborate the same day. Bab el-Mandeb is about 29 km at its narrowest and an analyst quoted by Al Jazeera says it could be controlled ‘just with artillery’. (!) **The Houthi spokesman states that navigation and trade ‘remain safe and uninterrupted’**; while the ban on Saudi ships stands, and both halves are published. **Saudi retaliation, 10 September.** Strikes on Taiz, Hodeidah, al-Jawf and Marib: 40 on one count, 54 on the Houthis’ own. (!) **Two counts, attributed, never merged** — and this DISCHARGES the open item published last edition as a promised reply that was NOT SOURCED. **The 8 September barrage** on Jazan, Najran, Abha and Khamis Mushait is now on the UN record in Saudi Arabia’s own words: its ambassador condemned ‘the September 8 strikes that wounded 73 civilians’ on 10 September, which independently confirms the date correction this document published yesterday. **Yemen, at the Security Council on 10 September.** The UN envoy told the Council Yemen faces ‘a new and more dangerous phase of war’, with over 11,400 households displaced since 3 September on his count and 6,145 families on Yemen’s own — (!) two counts on two bases, not merged. (!) **NOT ASSERTED: the Al-Azraq damage claim.** A single source reports an A-10 wing and about eight F-15E aircraft damaged at Muwaffaq Salti. It contradicts Jordan’s own TIER 1 statement that the two leakers fell in unpopulated areas with no casualties. **Both are on the record and neither is adopted.** (!) **NOT ASSERTED: a US strike on Iranian soil.** Iranian state media reported projectiles striking areas of **Sirik**, timestamped late 9 or early 10 September, with damage and casualties explicitly unavailable; there is no US acknowledgement. It is TIER 3, it does not meet the ‘acknowledged’ bar, and the nine-day window is published with it named.

A2.3.7 · The absences that are findings

What was sought	How it was probed	Result
A CENTCOM release dated 9, 10 or 11 September	The centcom.mil press-release index read directly, plus DVIDS as an independent host	**NONE.** The newsroom’s three September items are the 1st, 5th and 8th. (!) The pagination parameter is IGNORED on that index and is NOT counted as a second probe (§9.64)
JMIC Update 096	A constructed URL on the confirmed 095 filename pattern	**404 — NOT YET PUBLISHED.** (!) No claim is made that it does not exist. Due 12–13 September on the 094/095 cadence
An Omani, Qatari or US mediation text dated 10 or 11 September	Direct search on each party	**NOT FOUND.** A FIFTH consecutive edition with no Omani text on the strait (§9.23). No US principal statement on talks in the window either
A Baltic TD3C assessment for the current week	The Baltic Exchange week-37 page and syndicated roundups	**NOT FOUND.** Week 37 returns 404. The 3 September assessment is published with its date and not as a current level
The SPR level for the week ended 4 September	The EIA weekly highlights PDF and the SPR series page	**NOT FOUND.** Both served stale editions. 286.6 mn bbl (28 August) is NOT carried forward
An 11 September transit count from any provider	Kpler, Lloyd’s List, LSEG, SeaVision, PortWatch	**NOT FOUND from any provider.** (!) Corridor throughput measures were not refreshed in this window, so this is an absence in the data rather than in the retrieval

A7 · SOURCE LOG

Every claim in the edition and this annex traces to a row below. **TIER 1** is a primary or official publisher, including a party to the conflict publishing about itself. **TIER 2** is established wire or trade press. **TIER 3** is state media or an unverified aggregator, and is never used alone for anything market-moving. **NOT OBTAINED** and **NOT FOUND** mean sought and missed; **PROSPECTIVE** means the session or publication had not occurred at the Singapore cut and is not a retrieval failure (§9.46).

A7.1 · Tier 1 — market and official data

Source	Used for	Date and state
Bloomberg extract, *US Iran BBG Data.xlsx*	Every scored series, the pre-war anchor and all deltas. 181 rows × 99 columns; columns resolved by header scan	Refreshed 11 Sep. Latest row 11 Sep intraday; latest full close 10 Sep
JMIC Update 095, hosted on ukmto.org	The 109 incident count and the '7 since the last report' line; the attempted-mining language; threat levels; UKMTO 128-26 to 132-26 and all eight vessels	ICOD 101500Z. **OBTAINED** and read direct 11 Sep. **096 returns 404 — NOT YET PUBLISHED**
US CENTCOM press-release index	The 8 Sep five-tanker release with five named vessels; the 1 Sep strikes on Iranian radars	Read direct 11 Sep. **No release dated 9, 10 or 11 Sep.** DVIDS probed as an independent host
Bureau of Labor Statistics	August PPI: +0.4% m/m, +5.4% y/y, core +0.3% and +4.7%, energy +4.2%, diesel +24.1%	Released 10 Sep 08:30 ET. (!) August CPI scheduled 11 Sep 08:30 ET — **PROSPECTIVE**
EIA Weekly Petroleum Status Report	Crude 424.1 mn bbl, –0.4; imports 6.8 mb/d, +53,000 b/d; utilisation 97.8%; gasoline +1.3 mn; distillate +2.1 mn	Published 10 Sep 12:00 ET for the week ended 4 Sep. (!) **SPR level NOT FOUND**
US Department of Labor	Initial claims 206,000 for the week ended 5 Sep; four-week average 206,000; continuing claims 1,774,000	Released 10 Sep 08:30 ET
AAA national averages	Regular $4.2770 and diesel $5.9773 for 10 Sep; the $5.0165 regular record of 14 June 2022	Read direct 11 Sep. (!) The 11 Sep values were NOT published at the cut
OPEC Monthly Oil Market Report	2026 demand growth cut to +380,000 b/d, a fifth consecutive downgrade	Published 10 Sep. **RETRIEVED**, after the last edition could not retrieve it at all
IAEA Board and UN Security Council record	The 9 Sep referral vote, 23–3 with 8 abstentions and 1 not voting; the 10 Sep Council session and the 1737 committee blockage	9–10 Sep. (!) press.un.org is JavaScript-gated — **NOT OBTAINED** directly

A7.2 · Tier 2 — wire, trade press and named data providers

Source	Used for	Date
Reuters via Al Jazeera	The Mokha seizure, on three named-as-Yemeni-government sources, with a correspondent on the ground; the Bab el-Mandeb geography and the analyst quotation	10 Sep
Bloomberg via multiple relays	Saudi Arabia's submission to OPEC: August output 6.238 mb/d, the lowest since 1990, down about 1.9 mb/d. (!) It is the producer's OWN figure but it reaches this desk at TIER 2, and the submission itself is not published	10 Sep 08:54 ET. (!) Bloomberg itself is paywalled to this desk
Al Jazeera and The National	The Saudi strikes of 10 Sep on Taiz, Hodeidah, al-Jawf and Marib — 40 on one count, 54 on the Houthis' own	10 Sep
Dealer-desk auction reporting	(!) **The WHOLE $22bn 30-year reopening result** — stop 5.308%, when-issued 5.335%, cover 2.612, indirects 79.5%, directs 18.3%, dealers 2.21%. TreasuryDirect itself is robots-blocked to this desk, so **every one of these figures is TIER 2**, not only the when-issued (§9.39)	10 Sep 13:00 ET
Kpler, UKMTO, Windward, Lloyd's List Intelligence	FOUR attributed transit universes with their own denominators, tabled at A1.4 with an unattributed fifth reading and a facilitated subset, and never spliced	8–10 Sep
CME FedWatch via dated wire coverage	The 62% September hike probability for 9 Sep and the 44% of a month earlier	9 Sep. (!) cmegroup.com could not be reached directly
Baltic Exchange week-36 report	TD3C at WS677.22 and a round-trip TCE near $704,000/day	Assessed 3 Sep. (!) **Week 37 NOT FOUND**
Breakwave tanker report	War-risk cover at 7.5–12.5% of hull value against ~0.25% pre-conflict; Basrah exports ~1.35 to ~2.35 mb/d	8 Sep
GasBuddy via regional press	The first crossing of $6.00 on its national diesel average	10 Sep
UN News and Al Jazeera	The 10 Sep Yemen session: 'a new and more dangerous phase of war'; 11,400 households and 6,145 families, two counts	10 Sep

A7.3 · Tier 3, and what is carried but not load-bearing

TIER 3, carried but never load-bearing. Iranian state media, for the report that projectiles struck areas of **Sirik** late on 9 or early on 10 September — it is the only counter-indication to this edition's nine-day kinetic window, it carries no damage or casualty figure, there is **no US acknowledgement**, and it does not meet the 'acknowledged' bar the window is written on. Iranian claims of agreed Hormuz maps and an imminent IMO filing remain uncorroborated and are unchanged. The straits.live dashboard, for a provider-unattributed and explicitly preliminary 'single digits on 10 September' transit reading, and for war-risk multiples on a basis it does not publish. Unverified war-casualty aggregators are **not cited at all**. (!) **SINGLE-SOURCE AND THEREFORE NOT ADOPTED:** the report of an A-10 wing and about eight F-15E aircraft damaged at Muwaffaq Salti, which contradicts Jordan's own TIER 1 statement; and a reported presidential claim of nine Iranian ships destroyed, which this desk could not trace to a wire. **STRUCK FROM THE LOG, unchanged from last edition:** jmic.online, which is an unrelated academic journal — and the correction is vindicated, because reading JMIC at its real address on ukmto.org produced Update 095 at the first attempt after three editions of failure.

A8 · ON-DEMAND UPDATE PROTOCOL

	Step	What it produces, and what went wrong when it was skipped
1	Parse the refreshed extract by HEADER SCAN, never by column index	Resolves CO2/CL2 and COA/CLA, the twenty scored series and the 27 February anchor. The 6 July relabelling of CO1/CL1 and the 3 August change in the dollar ticker were absorbed without a code change. (!) **Never build an edition off a stale extract** — check the file's save time AND the latest row, which are different failures (§9.22)
2	Run all THREE standing integrity checks, then reconcile	(a) §9.8, row-level: did the prior row refresh at all? (b) §9.35, field-level: is any field identical to four decimals, in which case it is UNRESOLVED and no d/d is asserted, whatever the state of the row around it. (c) §9.41, basis: does any continuation series show a sign change or a step against its active contract? (!) Add the §9.60 field-by-field diff against the last edition's PUBLISHED figures, recording three outcomes: settled, carried, **LOST**

	Step	What it produces, and what went wrong when it was skipped
3	Compute deltas, trigger distances and a full-column superlative sweep	d/d against the last confirmed close, w/w five sheet-rows back, and versus the 27 February anchor. (!) **Every superlative is checked against the WHOLE column before it is written, not after** (§9.32) — this edition, that sweep is what established that the 2-year's 15.61 bp is a war record while Brent's $5.62 is only the ELEVENTH largest rise of the war
4	Verify the news on two parallel tracks, and re-verify what was inherited	Military and diplomatic on one, shipping, energy and macro on the other, each told to answer **NOT FOUND** rather than estimate. (!) **A negative claim is a claim about the SOURCE and must be probed a SECOND, different way before publication** (§9.23, §9.64). Inherited claims, superlatives and series DESCRIPTIONS are re-verified on the same schedule as new ones (§9.13, §9.32, §9.57)
5	Score on CONFIRMED CLOSES ONLY, with hysteresis, then QA in four passes	No market channel moves on an intraday print; upgrades need a sustained break, downgrades a sustained reversal past a wider level. (!) QA is numeric, then STYLE, then **TWO adversarial prose reviewers run CONCURRENTLY against the same pre-fix text with no access to the source data**, merged and applied in one pass, then a VISUAL render (§9.34, §9.38, §9.59, §9.62)

A9 · METHODOLOGY

A9.1 · The engine, and what a score that MOVES does and does not mean

Six channels, each scored 0–5 and summed to **0–30**. Bands: 0–7 watch, 8–14 stress, 15–21 systemic-risk watch, **22–30** crisis. Maritime denial and escalation risk are EVENT channels and carry their own as-of dates; oil, US inflation, Treasury stress and political stress are MARKET channels and move only on confirmed closes. **Five of six channels have been at the ceiling since 4 August.** (!) **This edition is where the standing caveat earns its keep.** Since 10 July this document has said that further geopolitical deterioration CANNOT raise the score, because maritime and escalation are capped, and that only a MARKET channel could move the number. On 10 September the war widened to a second chokepoint — and the score moved, through the barrel, by **one point**. **The move is not a measure of the escalation**; it is a measure of the instrument. What the total still cannot show: the fall of Mokha, a seventeenth TTF record, a fourteenth Asia LNG record, five war-high Treasury closes, a 30-year absorbed at a record-low dealer take, and a diesel record set twice in two days. (!) **28/30 leaves two points of headroom and both sit in the oil channel**, which is now the only channel below its cap.

A9.2 · The two disciplines, and what they cost and earned this edition

(a) Confirmed closes only, and sustained means more than one. The oil channel held at 3 on 2 July through a sub-pre-war INTRADAY and was cut to 2 only on the second confirmed close, on 3 July; the US-inflation channel held at 3 on 14 July on a 0.6 bp margin and fired on the 15th on the second close; an oil downgrade taken on 25 June had to be reversed on the 26th. (!) **The 10 September edition applied that rule at its most uncomfortable**: it held the oil channel at 2 on a mark of $97.00 whose session low was ALREADY through the trigger, and said in terms that a mark is not a close. **The close came in $5.72 above the mark.** The delay cost one edition and bought the certainty that the upgrade rests on two settled prices rather than on a morning quotation that happened to be right. **(b) Hysteresis.** Upgrades fire on a sustained break; downgrades require a sustained reversal past a WIDER threshold. (!) **That rule now binds this document in a new place.** Having fired oil 2→3 on **$95**, a symmetric 3→2 downgrade at **$95** is FORBIDDEN by (b), and no wider level is on the record. **No level is set in this edition**, because §9.26 forbids setting one under the pressure of a trigger that has just fired — the same reasoning that refused to move the 5y5y firing level in August. The 3→4 upgrade is likewise not on the record and is not invented. **Both are OPEN, and the next edition must publish both**, before the price is near either.

A9.3 · §9.56 — the trigger level inside the basis, and how it RESOLVED

§9.56 was opened on 2 September and has been described since as the largest open methodological problem in this document. The problem: the **$95** oil trigger is written on the CONTINUATION series (CO2), but the continuation and the ACTIVE contract (COA) diverged after the 31 August roll, and the trigger level sat BETWEEN them. Two defensible readings — score the series the rule names, or score the contract the market trades — gave OPPOSITE answers, and the rule's own text did not choose. **§9.56c required the problem to be disclosed while the distance was still positive**, so that nothing would be decided under the pressure of a fired trigger, and it was. **The resolution came in two steps and neither involved changing the rule.** On 9 September the level fell below BOTH series — CO2 $97.10, COA $101.21 — which removed the geometric ambiguity but not the scoring one, because the continuation had one close and the active had six. **On 10 September the continuation took its second close**, at $102.72, while the active took a seventh at $107.63. **Both readings now fire, so §9.56 is RESOLVED and CLOSED.** (!) Two things are recorded so the resolution is not over-claimed. **First, the rule remains written on the continuation**, and if the two series diverge across a future roll the ambiguity returns; §9.36 and §9.36b are unchanged and both bases are still quoted wherever a trigger distance appears. **Second, the resolution was luck as much as design** — the price moved far enough fast enough that the readings converged. Had it stalled between the two series, this document would have had to choose, and §9.56 would still be open.

A9.4 · Integrity rules, and what each one ACTUALLY tests

Rule	What it tests	State this edition
§9.8	Row-level: did the prior row refresh at all, or is it a stale snapshot?	**CLEARS.** Eighteen fields moved on the 10 September row
§9.35	Field-level: is any single field identical to four decimals, and therefore UNRESOLVED?	(!) **FIRES on SOFR alone**, which backfilled to 3.64 identical to the 8th. (!) An overnight benchmark repeats routinely, so this is the least informative field for it to fire on — but the test is mechanical, the value is PROVISIONAL, and **no conclusion rests on it**
§9.41	Basis: does a continuation show a sign change or a step against its active contract, indicating a roll?	**CLEARS.** Brent basis 4.11, 4.91, 5.17; WTI 3.18, 4.08, 4.28. Both widened smoothly
§9.60	Did any cell published as a mark later go BLANK rather than settling?	(!) **DID NOT REPAIR, fourth extract.** WTI, CLA and Henry Hub remain blank on the 7 September row and are recorded as LOST, not unchanged
§9.37	May a reconciliation gap be computed against a field published as UNRESOLVED?	No, and it does not arise: nothing was published UNRESOLVED last edition, so all fifteen marks reconcile
§9.69	Is the 2s10s derived from the 2- and 10-year, or independently published?	Independently published, and it does NOT equal the difference on any row: 37.70 computed against 37.496 printed

A9.5 · Denominators, negatives, and the withdrawal in this edition

§9.19 forbids splicing two series that measure different things, however similar their labels. It is applied five ways in this edition. The FIVE retail fuel series are kept apart, which is why a six-dollar diesel headline is reported as true of GasBuddy's national panel and not yet of AAA's. The five transit universes are kept apart, and the maritime percentage-of-normal test is run only where one provider supplies both numerator and baseline. War-risk cover quoted as a percentage of hull value is not combined with figures quoted in dollars per voyage. The SPR figure for 28 August is not carried forward as a current level. (!) **And the rule caught a failure of this document's own**: the 10 September edition reported the September hike as 'near 56%, down from about 66% on 31 August', splicing a prediction-market price onto a CME FedWatch series. **That comparison is WITHDRAWN.** The error was not merely one of precision — **it inverted a direction**, reporting a market backing away from a hike when the CME series had risen from 44% to 62% over the month. The two venues are now published separately and never differenced across. **§9.23 governs negatives**: a negative claim is a claim about a SOURCE, and must be probed a second, different way. The CENTCOM negative rests on the press-release index read directly plus DVIDS as an independent host; the pagination parameter is known to be ignored on that index and is NOT counted (§9.64). The JMIC 096 negative is stated as NOT YET PUBLISHED on a 404 against a constructed URL, and **no claim is made that it does not exist**. (!) **§9.65: a date, a window and a source ADDRESS are all figures**, and are withdrawn by name when wrong. Last edition withdrew two dates; this edition withdraws a spliced probability and supersedes a structural reading of its own that was one session old.

A9.6 · Restatements, comparability, and the open items carried forward

Vendor restatements are normal in this extract and absolute levels are not comparable with pre-restatement editions; directional analysis is continuous. The 31 August Brent roll remains the live discontinuity and no day-on-day or week-on-week comparison on the SCORED continuation crosses it. (!) **The active-contract series is different and is labelled as such**: COA's anchor comparison to 27 February necessarily spans several rolls, so its +51.85% is a series level against a series anchor and NOT a same-contract return. **Open items carried into the next edition.** (!) **FIRST and largest: the oil channel's 3→4 upgrade and 3→2 downgrade levels**, neither of which is on the record and neither of which is set here (§9.26). Second: §9.57, the AUTMUSAG series description, WITHDRAWN and unreplaced, with its spread test UNTESTED until the DOE print of 14 September. Third: §9.61, whether a distillate record belongs in a channel scored on gasoline — a SCOPE question, now weightier because August producer prices put diesel at +24.1% on the month. Fourth: §9.60's three lost cells, blank in a fourth extract. Fifth: JMIC 095's own incident arithmetic, 101 plus 7 against 109, left for Update 096 to settle. Sixth: the Iranian claims of agreed Hormuz maps and an imminent IMO filing, uncorroborated for a fifth edition. **Items DISCHARGED this edition:** §9.56, resolved and closed; the three-edition JMIC 095 retrieval failure; §9.28's import-reversion test, resolved to no reversion; the IAEA vote count, found; the Saudi reply, sourced; and CENTCOM's five-tanker claim, corroborated by an adjudicating product.

A10 · ANCHOR AND TRIGGER LEVELS

A10.1 · Pre-war anchor — 27 February 2026 close (USRFRUSA weekly, 23 February), re-verified field by field this edition, unchanged

Field	Anchor	Latest close	Change	Field	Anchor	Latest close	Change
Brent CO2	72.48	102.72	+41.72%	2s10s	55.64	37.496	–18.14 bp
Brent COA	70.88	107.63	+51.85%	10y breakeven	2.2569	2.4165	+15.96 bp
WTI CL2	67.02	98.40	+46.82%	5y5y forward	2.142	2.3295	+18.75 bp
WTI CLA	66.18	102.48	+54.85%	MOVE	73.38	82.09	+8.71
Henry Hub	3.063	2.834	–7.48%	VIX	19.86	17.84	–2.02
TTF	31.227	82.047	+162.7%	SOFR	3.68	3.64 (9 Sep)	–0.04
Asia LNG	1,669	4,198	+151.5%	Dollar index	97.608	99.048	+1.48%
2-year	3.3749	4.5856	+121.07 bp	Gasoline AUTMUSAG	3.52	5.05 (9 Sep)	+43.5%
5-year	3.5017	4.7618	+126.01 bp	Gasoline DOE, 23 Feb	~2.94	4.157 (7 Sep)	~+41%
10-year	3.9375	4.9626	+102.51 bp	20-year, unscored	4.5505	5.3915	+84.10 bp
30-year	4.6106	5.3652	+75.46 bp				

(!) **THREE series now close BELOW their pre-war anchors**, from four. Henry Hub, the 2s10s spread and the VIX; **SOFR is shown at its 9 September value and §9.35 fires on it**, so it is PROVISIONAL. Henry Hub remains the only ENERGY series below anchor, and that is the load-bearing evidence for a routing and loading shock rather than a global one. (!) **ALL FIVE tenors set new war-high closes on 10 September**, the 20- and 30-year taking out their 17 August peaks of 5.3016% and 5.3060% after sixteen trading sessions — which SUPERSEDES the migration reading published last edition. Dates are given in-cell where a series has not resolved to 10 September. (!) Change units follow the field: per cent for prices, basis points for yields and spreads, index points for MOVE and the VIX.

A10.2 · Live trigger state — every channel on the 10 September close, with events to 11 September

Channel	Upgrade	Downgrade	Live distance
Maritime denial — 5	At the cap	Verified reopening AND traffic above 25% of normal for ten sessions	No reopening verified by any provider. Kpler at 10 vessels/day on its own 10-day mean, against its own base above 130, is under 8%. (!) Both legs unmet, and no baseline is agreed
Oil price shock — 3	(!) **NOT ON THE RECORD.** No 3→4 level has ever been published by this document, and none is invented here	(!) **NOT SET.** §4(b) requires a level WIDER than the $95 that just fired, so a symmetric $95 is forbidden; §9.26 forbids setting one on the day a trigger fires	(!) **FIRED 2→3 on TWO confirmed closes above $95**: $97.10 then $102.72, the second $7.72 through, with a session low of $96.14. COA $107.63, a seventh consecutive close through. **BOTH LEVELS ARE OPEN and the next edition must publish them**
US inflation impulse — 5	At the cap	5y5y sustained at or below the 2.142% anchor → 4	18.75 bp above the anchor, from 17.46 — further away. A **SEVENTH** close above the 2.30% firing level, clearing by 2.95 bp, the widest of the run. BE10 15.96 bp above its own anchor
Treasury stress — 5	At the cap	30-year below 5.00% WITH MOVE below 75, sustained → 4	(!) **Both legs failed and both widened sharply.** Yield leg fails by 36.52 bp, from 28.89. Volatility leg fails by 7.09, from 1.74, on a THIRD close above 75 — the miss quadrupled in one session
Political stress — 5	At the cap	Three consecutive AUTMUSAG closes at or below $4.60 with no intervening print above $4.70 → 4	**45 cents** above the condition on a $5.05 print, from 40 — further away, and the condition needs three such closes. The 10 and 11 September cells are blank
Escalation risk — 5	At the cap	A mediated stand-down WITH talks resumed → 4–3	No convened talks and no counterparty text for a fifth edition. (!) Against a downgrade: a SECOND chokepoint changed hands. The only forward dates on the file are UN sanctions deadlines

A10.3 · Stage-4 thresholds — levels and live margins

A — an auction clearing with a tail above its when-issued level. NOT ARMED, and for the first time in this war **not armed on EVIDENCE rather than on untestability**. The $22bn 30-year reopening of 10 September stopped at 5.308% against a 5.335% when-issued: a **2.7 bp stop THROUGH**, the opposite of a tail. (!) Treasury still publishes no when-issued level, so that figure is a dealer-desk number at TIER 2 and **§9.39 is NOT relaxed**; the point is simply that even the TIER 2 figure arms nothing. Composition: bid-to-cover 2.612 against a 2.38 average; indirects 79.5%; directs 18.3%; **primary dealers 2.21%, the lowest on record**, against 11.51% on 13 August. (!) It is a REOPENING and is NOT comparable on concession with the **$25bn** new issue of 13 August that cleared 5.216%. **B — the 30-year above 5.20% WITH the 10-year above 4.65%**. ARMED, and the run EXTENDS to a NINTH close on a single arming: 28 and 31 August, then 1, 2, 3, 4, 8, 9 and 10 September, 7 September excluded because a shut market wrote no close (§9.58). Both legs cleared by their widest margins of this arming by a wide distance — the 30-year by 16.52 bp and the ten-year by 31.26 bp. The long-leg clearance sequence reads **0.56, 4.23, 7.30, 5.71, 4.65, 4.23**, 4.54, 8.89, 16.52 bp. (!) **The standing reading that 4.65% and 5.20% are the middle of the distribution rather than its edge is SUPERSEDED**, contradicted on two consecutive closes with the margin roughly doubling each time. (!) The sequence is still NOT monotone and is recorded as such. **C — MOVE above 130. NOT ARMED at 82.09**, some 47.91 points below; the war high of 115.02 was set on 26 March. (!) The direction carries the information: MOVE rose 5.35 points in a session, closed above its 73.38 anchor for a THIRD session and is at its highest since 31 July, while the 30-year sits 75.46 bp above its own anchor. The August divergence — a normalised expectation of movement around a yield that had not normalised — is closing fast **from the volatility side**.
