

ANNEX · 10 SEPTEMBER 2026

This annex is the companion to the 10 September 2026 edition and is built every day. The edition is capped at eight pages; material is RELOCATED here, never deleted. Section numbering tracks the edition: **A1** carries the full commentary for the live-tape tables and the gasoline chart, the full strait-operational record and the freight and war-risk record; **A2.3** the full cross-asset and macro record and the SPR withdrawal; **A7** the source log; **A8** the on-demand update protocol; **A9** the methodology; **A10** the anchor and trigger levels. A figure marked **NOT OBTAINED** — or, equivalently, **NOT FOUND** — was sought and missed, and is absent from the record rather than unchanged. A figure marked **PROSPECTIVE** relates to a session or publication that had not occurred at the Singapore cut and is not a retrieval failure (§9.46).

A1 · LIVE TAPE — FULL COMMENTARY

A1.1 · Data integrity — all three standing checks CLEAR, and \$9.60 did NOT repair

The extract holds 180 data rows across 99 columns, from 31 December 2025 to 10 September 2026. Column positions are resolved by header scan every edition and never hardcoded (§3, §9.4); Brent and WTI resolve to **CO2 Comdty** and **CL2 Comdty**, with the active contracts at **COA** and **CLA**. **§9.8, the row-level test, CLEARS**. Eighteen fields moved on the 9 September row against the 8th, so no stale-snapshot condition exists and the d/d deltas are sound. **§9.35, the field-level identical-to-4dp test, CLEARS** on all three of the 8th, the 9th and the 10th. Not one field on any of those rows repeats its predecessor exactly. (!) That is the first unbroken three-row run of this test since the week before Labor Day, and it matters most on the tenors that set records: the 2-, 5- and 10-year war highs of 9 September rest on values that are demonstrably fresh, which is exactly the failure mode §9.35 was written for after a carried 30-year concealed a war high on 17 August. **§9.41, the continuation-versus-active basis check, CLEARS**. The Brent basis reads 3.54, 4.11, 4.19 across 8–10 September and the WTI basis 2.84, 3.18, 3.46: both widened, both smoothly, neither changed sign and neither stepped. There is no roll in this window. The Brent roll of 31 August remains the live discontinuity and no day-on-day comparison in this edition crosses it. (!) **§9.60 DID NOT REPAIR, in a THIRD consecutive extract**. WTI CL2 at 88.96, CLA at 91.95 and Henry Hub at 2.929 were published as 7 September marks, from this extract, and all three cells are still blank. Per §9.60b those cells yield NO close: no day-on-day change is asserted across them, and the 8 September figures for those three series are compared to 4 September, skipping a session. §9.10's two-way backfill test has now run three times and returned nothing; the values existed, and they are gone.

A1.2 · Reconciliation of the 9 September snapshot — and for a SECOND edition the excluded field would have been the largest miss

FIFTEEN marks were published for 9 September. FOURTEEN reconcile. ONE is excluded by name. The five-year was published UNRESOLVED under §9.35 — it repeated 4.5627 exactly — and §9.37 forbids computing a reconciliation gap against a field published as a carry, because such a gap measures staleness in the extract rather than the timing of the Singapore cut. (!) It settled at 4.6163, which against the repeat would have been a **5.36 bp** difference — the SECOND largest rate figure on this table, behind the ten-year's **5.44**. It is nonetheless a figure the exclusion kept out of a table it would have sat near the top of, which is the point of §9.37: the rule prevents a manufactured headline, and it costs one line of under-claiming to do it. **Of the fourteen measured, THIRTEEN settled ABOVE their marks and ONE below**. (!) **CORRECTED THIS EDITION: the 2s10s IS an independent observation and is no longer excluded**. USYC2Y10 is a separately published index and does NOT equal the ten-year less the two-year on ANY of the 179 rows in this extract — 41.11 computed against 40.691 printed on 9 September, a mean absolute difference of **0.40 bp**. The 'consistent by construction' line this document has carried is withdrawn, and the count above stands at fourteen. Energy: Brent +\$1.49, COA +\$1.70, WTI +\$1.29, CLA +\$1.32, TTF +€2.476; Henry Hub alone below at −\$0.067. Rates: 2-year +3.35 bp, 10-year +5.44, 20-year +4.52, 30-year +4.98, breakeven +1.36, forward +0.63, 2s10s +1.878. Dollar +0.019. Six series carried no mark at all: Asia LNG settled 4,115, MOVE 76.74 and VIX 16.46 into blank cells, while SOFR and both gasoline series stayed dark. (!) **This is the second consecutive one-directional upside miss** — the 8 September cut understated Brent by \$1.06 and the 9 September cut by \$1.49 — and it bears directly on the only live scoring question in this edition. If the morning cut systematically understates a rallying tape, the \$97.00 mark for 10 September is conservative and the second close is likelier than the mark alone implies. (!) **That inference does not move the score**. It is allowed to bear in exactly one place, the \$5 containment line, and that is disclosed there. A mark is not a close, §9.31 was written after four intraday-led claims were withdrawn in a session, and §9.17 holds that the reconciliation error is regime-dependent: 31 July ran +\$1.97, 4 August −\$3.99 and 5 August +\$0.10. The channel is held on the rule.

A1.3 · Energy and gas — full commentary

Brent, the scored continuation. Closed \$97.10, up \$2.72, \$2.10 through the **\$95** upgrade and +33.97% on the **\$72.48** pre-war anchor. On the week it is +\$5.01 against the 2 September close, the five-row base. (!) **The safe formulation on the July precedent**, per §9.36a: the continuation closed above **\$95** on 23 and 24 July at \$100.69 and \$96.78, and those closes sit on the far side of a roll on which the ACTIVE contract never cleared the trigger, at \$94.26 and \$91.68. It is therefore wrong to say Brent has not closed above **\$95** since the channel was cut. What is true and narrow: **9 September is the first close since the channel was cut to 2 on 3 July on which BOTH bases cleared \$95**, and the first of any kind since 3 June. **Brent, the active contract**. Closed \$101.21, up \$3.29, a **SIXTH** consecutive close through **\$95** and the first above \$100 since 22 May. It is +42.79% on its own \$70.88 anchor. (!) Both bases are quoted wherever a distance to the oil trigger appears, per §9.36b, and the rule remains written on the continuation. **WTI**. CL2 \$92.87, up \$2.68; CLA \$96.05, up \$3.02. No trigger is written on WTI. **Henry Hub**. Closed \$2.822, down \$0.094, at 7.87% below its \$3.063 anchor — its widest close since 25 August, which at 7.90% was wider still, so no war superlative is claimed. (!) The 10 September mark of \$2.795 is 8.75% below and would be wider than either, but it is a mark. **Henry Hub is the only ENERGY series below its pre-war anchor**; the 2s10s, the VIX and SOFR are also below theirs. The divergence is the load-bearing evidence that this is a Hormuz routing and loading shock rather than a global energy shock: US inventories run about 5.2% above their five-year average on production near **112.9 Bcf/d**, so American gas is abundant precisely while European and Asian gas is not. **TTF**. Closed €79.246, up €3.405, a **SIXTEENTH war-record close** counted from 28 February and the first above €79, at +153.8% on its €31.227 anchor — the largest multiple anywhere on this tape. Reported as the highest since December 2022. The attributed cause is not Hormuz alone: QatarEnergy has extended force majeure on LNG cargoes into the autumn and EU storage sits near 66% against a five-year seasonal norm around 80%. (!) **Three quotations of TTF are in circulation this week and they are NOT averaged** — the scored series at €79.246, a front-month continuous quote at €77.90, and a headline 'above €80' whose article could not be read. The scored series is the one every figure here is computed on. **Asia LNG**. Closed ¥4,115, up 140, a **THIRTEENTH war-record close** counted from 28 February, taking out the ¥4,010 of 7 September, at +146.6% on its ¥1,669 anchor. (!) **An open item, stated rather than buried**: no external assessment in yen could be sourced for this window, and the assessment provider behind the extract's JGLA series could not be identified from public material. That is a \$9.57-class question about a series DESCRIPTION, not a doubt about the series, which is continuous and pre-dates the war. It is left open.

A1.4 · Strait operational — the full record, every provider, every denominator

Provider	Reading and date	Denominator — what is actually counted
Kpler	11 commodity crossings, 8 Sep; 10-day mean 13; recent run 5, 11, 6, 11	Commodity vessels EXCLUDING naval auxiliaries, offshore support, tugs, coastal and small craft. (!) The only provider with a clean week-on-week run, so it is the trend indicator (\$9.24)
Windward	15 transits, 7 Sep — 6 inbound, 9 outbound; 3 dark of 15	Mixed tanker, bulk and cargo; no dwt threshold published. (!) Also records 38 vessels over 50 m stationary at the north Hormuz and Larak anchorage, most dark, building over days — a QUEUE, not a transit statistic
TankerMap	1 on 8 Sep, 0 on 9 Sep, 0 on 10 Sep; 7-day mean ~1.0	TANKERS ONLY — LNG, crude and product. A different universe from every other row and reported beside them, never reconciled to them
Lloyd's List Intelligence	~12/day all cargo over 10,000 dwt, 26 Aug–1 Sep; ~14/day non-Iranian-linked over a DIFFERENT and earlier week, 17–23 Aug. (!) Not a subset relation across a common window	Cargo-carrying vessels OVER 10,000 dwt only. The narrowest tonnage screen on this table
JMIC / US NCAGS	39 US-facilitated transits per 48 hours, 30–31 Aug (Update 092)	US NCAGS facilitated transits PLUS S&P Maritime and SeaVision cargo vessels over 1,000 dwt, excluding vessels calling Iranian ports. Baseline ~138/day (2025). (!) A FACILITATED SUBSET, not total traffic
IMF PortWatch via straits.live	6 vessels, 30 Aug, at 7% of its own base	PortWatch's own 85/day baseline, not UKMTO's. Weekly refresh, so the dashboard lags. TIER 3 and unrefreshed for this window
CENTCOM	More than 100 redirected since April, 4 disabled, 26 humanitarian permitted; 9 Sep	(!) Reached this desk only through a TIER 2 relay — the primary CENTCOM text carrying these figures was NOT FOUND . Crossed 100 from a 94 baseline dated 7 September

(!) **THE BASELINE IS DISPUTED FOUR WAYS AND NO PERCENTAGE OF NORMAL IS QUOTED WITHOUT ONE.** In circulation this week: 85/day (PortWatch), 100/day, **130–140/day** (Kpler pre-war) and 138/day (JMIC 2025). Three providers, three numerators and three bases give 7%, 8.5% and 14% — (!) **neither the numerator nor the denominator is common, so the spread is NOT the baseline alone** — which is why the maritime downgrade test in §2.1 is run solely where one provider supplies both numerator and baseline (\$9.19, \$9.24). **Retrieval, stated exactly.** JMIC Update **095 is NOT OBTAINED for a third edition**, after four probes: guessed sequential filenames for 095 and 096, the 2026 advisories index, which renders 'No products to display', and the mscio.eu mirror, stale at Update 053. **No claim is made that it does not exist** — 404s against constructed URLs are the same evidence class that failed this document on 8 September (\$9.64). (!) **A method correction: JMIC products are hosted on ukmto.org**, and jmic.online is an unrelated academic journal. It is struck from the source list permanently. UKMTO's own incident and advisory indexes are JavaScript shells that render empty to a fetcher and are **NOT OBTAINED**. Update 094, cut at 051500Z, remains the standing product: Hormuz **SEVERE**, overall Middle East maritime risk **SEVERE**, a **30 nm** standoff from US military units advised, deliberate hostile action assessed as highly likely, and traffic expected to stay below the 2025 baseline. It corroborates the 5 September strikes by name — **M/T Stark 1** near Jask, **M/T Downy** near Kharg, **M/T Kylo** disabled and sunk in the Gulf of Oman — but it closes before the 8 September strikes, so **no allied product corroborates the five-tanker claim**.

A1.4a · Primary text — the statements the judgment rests on, verbatim

Speaker, date, tier	Text as published
US CENTCOM release, 8 Sep — TIER 1, a party to the conflict	'U.S. Destroys 5 IRGC Tankers After Iran Targets Another American Warship'. Named: M/T Kaviz , M/T Charminar , M/T Horizon 1 , M/T Riesco in the Gulf of Oman and M/T Derya near Kharg Island; all 'rendered inoperable', crews directed to abandon ship first, 'No American personnel were harmed'. (!) The targeted warship is NOT named
US Secretary of State, 9 Sep — TIER 1, a party to the conflict, via a TIER 2 relay	'For every time they try to hit US Navy ships, they're going to lose tankers.' (!) It READS as an explicit exchange rate rather than as interdiction. (!) That is an inference from one statement by one party, and no US document states the policy in those terms
US President, 9 Sep — TIER 1, a party to the conflict, via a TIER 2 relay	Talks with Iran 'could happen', and the war would end 'immediately' after November's midterm elections
Qatari MFA and Prime Minister, 8 Sep — TIER 2	'Qatar and the countries of the region are quite keen for the opening of the Strait of Hormuz unconditionally because this is a top priority'; 'new ideas are being discussed'. The Prime Minister took the file to Wang Yi in Beijing the same day
Oman–Iran joint statement, 25 Aug — TIER 1, the standing text	Commits to 'the establishment of a joint temporary navigational corridor through the Strait of Hormuz', phased, with mine-clearing and later technical talks on a permanent corridor. (!) It contains NO mention of IMO registration — the IMO element is an Iranian claim only
Iran SNSC secretary and MFA spokesman, 6 Sep — TIER 3 state media: uncorroborated	Maps agreed with Oman 'would be signed in the coming days'; talks at their 'final stage' and to be registered with the IMO 'within days'. (!) No Omani text, no IMO record . One outlet HEADLINED that the filing had occurred; its own body says no filing had been reported, so the headline is discarded

A1.5 · Retail fuel — FIVE series, never SPLICED, and a record run that ended and then resumed

Series	Latest	Record and denominator
AUTMUSAG — Bloomberg, the SCORED series	\$5.00, 8 Sep	Peak \$5.18, 20 May. Vendor description is only 'US Average Gasoline Price'. (!) Its caption as 'AAA all-grades' remains WITHDRAWN and unreplaced (\$9.57)
USRFRUSA — DOE regular retail spot, weekly	\$4.157, 7 Sep	Peak \$4.50, 11 May. (!) CORROBORATED this edition : EIA published on 9 Sep for the 7 Sep date at \$4.157, matching the extract exactly
AAA national regular	\$4.2245, 9 Sep	All-time record \$5.0165, 14 June 2022. Current reading is 15.8% below it
AAA national diesel	\$5.9424, 9 Sep	(!) THIS IS THE RECORD — a fresh all-time high set on 9 September, +4.12 cents
EIA on-highway diesel, weekly	\$5.967, 7 Sep	A different survey panel and reference date from AAA. (!) It reads ABOVE AAA's later figure, which is why the two are never spliced

(!) **THE DIESEL RECORD RUN DID NOT END**, AND THE LAST EDITION'S OBITUARY FOR IT IS SUPERSEDED. This document reported the run over at \$5.9012 on 8 September, three hundredths of a cent under the \$5.9015 of the 7th. AAA set a fresh all-time high of \$5.9424 on 9 September. (!) A second,

narrower correction attaches: AAA's page publishes only the standing record and the previous day's value, so the **\$5.9015 figure for 7 September could NOT be re-verified from the primary source** and is not restated here. **The \$9.57 reconciliation moved**, and it moved against the scored series. Recomputed this edition over the 36 dates since 5 January on which AUTMUSAG and USRFRUSA BOTH resolved, the spread means **64.7 cents**, with a minimum of **51.6 cents** on 16 February and a maximum of **77.3 cents** on 7 September — the highest of the recomputed window, exceeding the **75.9** of the previous observation, which sits inside that same window and IS comparable — on the **NINTH consecutive widening across ten observations**: 60.3, 60.5, 64.9, 65.4, 68.1, 68.4, 72.1, 73.5, 75.9, 77.3. (!) The **65.6-cent MEAN** carried since 4 September was computed over a window this document never stated and is therefore not comparable with the 64.7 above; neither is called wrong, and the window and count are stated here so the next edition can test them. **A spread described as structurally stable has now widened on nine consecutive observations and set a record.** That is a finding about the scored series, not about the corroborating one. On the same date, 8 September, AUTMUSAG reads **\$5.00** and AAA regular \$4.1514 — **84.9 cents** apart, with AAA diesel at \$5.9012. The scored series sits between the two AAA grades and matches neither. (!) \$9.61 stands and is not reopened here: AUTMUSAG is a GASOLINE series tracking gasoline faithfully, and whether a distillate series belongs in the political channel is a SCOPE question that the edition discovering it does not get to settle (\$9.21, \$9.56b).

A1.5a · US retail fuel chart — relocated from §1.6

Navy: **AUTMUSAG**, the scored series, daily, ending 8 September at **\$5.00**. Amber with markers: **USRFRUSA**, DOE regular-grade retail spot, weekly, ending 7 September at \$4.157. The dotted line at **\$4.75** is the level that fired political stress 4→5 on 4 August; the dashed vertical marks the 28 February war start. Pre-war dots: **\$3.52** navy at 27 February, **\$2.94** amber at 23 February. (!) **Neither line is AAA regular and neither is AAA diesel.** Neither series is extrapolated beyond its last resolved print.

A1.6 · Freight, war risk and ports

War-risk insurance. (!) **No quotation for 8–10 September carries a stated hull-value denominator, so none is used for a rate.** The most recent figures with an explicit basis are dated **23 July** and attributed to Marsh: Hormuz oil tankers at **7.5–10% of hull value** against a 1–3% pre-war baseline; **\$77.96 per metric tonne** for a 270,000 mt tanker, roughly \$21m a voyage, against a five-year average of \$18.91/mt; a March peak near \$140/mt; Bab al-Mandeb at 0.5% and the western Saudi route at 0.1% of hull value. (!) The only current-window figure, a dashboard reading of 40.0× pre-crisis and about \$10.0m a voyage, names **neither the hull value nor the percentage basis** and is therefore NOT comparable with the Marsh series and is not joined to it (\$9.19). **Bypass pipelines.** The standing table — Petrolin at 95% of 5.0 mb/d, ADCOP at 100% of 1.5, Goreh–Jask at 40% of 0.35, about 6.4 mb/d combined against a normal Hormuz flow near 17 mb/d — is explicitly editorial estimate built on EIA reference capacities rather than telemetry, and the page carrying it was last updated roughly four months ago.

Current bypass utilisation is NOT FOUND and the figures are reproduced as TIER 3 with that age attached. **Kharg Island.** **NOT FOUND** for 8–10 September: no loading count, volume or date could be obtained, and the one on-point article returned a 404. What is on the record is kinetic rather than commercial — **M/T Downy** was struck near Kharg on 5 September and **M/T Derya** on the 8th. **Ambient AIS.** A dashboard reading for 9 September records about 1,688 vessels tracked in Gulf AIS over 24 hours, 234 holding position away from berth and 35 dark tankers against a 7-day baseline of 67.5. (!) That dark-tanker figure is roughly half its own baseline in the same week Windward reports a growing dark queue at Larak, and the two are NOT reconciled here: they are different universes and one of them is a stock while the other is a flow.

A2.3 · CROSS-ASSET AND MACRO RECORD — FULL

A2.3.1 · One trading session, and the war high migrated down the curve

The 9 September close is a full settlement across every daily series. By tenor the move reads **2-year +3.59 bp, 5-year +5.36, 10-year +5.24, 20-year +3.87, 30-year +4.35**. (!) **That is a HUMP, not a monotone shape**, and it is not described as one — the belly led and both wings lagged. The 2s10s **STEEPENED** 1.44 bp to 40.691 while the 5s30s flattened, so a single label does not fit the curve and none is applied. **Where the records fell is the finding.** The 2-year at 4.4295%, the 5-year at 4.6163% and the 10-year at 4.8406% are all new war-high closes and all new highs for the extract, which begins 31 December 2025. The **20-year at 5.2908%** and the **30-year at 5.2889%** are NOT: both remain below their **17 August** peaks of 5.3016% and 5.3060%, and have been for sixteen sessions. (!) The 30-year is 1.71 bp short of a high set three weeks ago while the 5-year has set two in two days. **For most of this war the long end led**, which is the signature of a term-premium and fiscal-supply story. A belly-led selloff is the signature of a policy story, and the market is priced near 56% for a 25 bp hike on 16 September against a 3.50–3.75% target range. On the week, five rows back to 2 September: 2-year +6.05 bp, 5-year +8.24, 10-year +6.26, 20-year +2.97, 30-year +3.18 — belly-led over both horizons — (!) though not the same shape: the 2-year is the smallest daily mover and the third-largest on the week. The **LEADERSHIP** is what repeats, and that is what makes it a regime. **Inflation compensation moved with it:** BE10 +1.28 bp to 2.3879%, its highest since 3 June and 13.10 bp above its anchor, and the 5y5y forward +0.47 bp to 2.3166%, 17.46 bp above its own. (!) One month ago this document was reporting BE10 0.21 bp above pre-war and asking whether one basis point would take spot compensation below it for the first time in the war. **The entire mid-August normalisation has been given back**, over the past MONTH, of which 1.28 bp came on 9 September; the scored barrel rose **\$5.01** on the week and no weekly breakeven is computed here. **Volatility did not confirm the stress.** MOVE closed 76.74, up 0.60 and 2.97 lower on the week, above its 73.38 anchor for a second session. VIX closed 16.46, up 0.74 but still 17.1% below its own anchor. The dollar closed 98.817, effectively unchanged on the day and 0.78 lower on the week. (!) **A flat dollar means the barrel's rise is NOT being cushioned for non-dollar buyers** — the reverse of the mechanism that softened the July move.

A2.3.2 · The data calendar — what has landed, what has not, and the difference

LANDED. The EIA Short-Term Energy Outlook, 9 September. Brent forecast near \$90 for 2H2026, \$77 for 2Q2027 and \$67 for 2H2027, with most production and trade flows expected back to pre-conflict averages by Q2 2027 and some Gulf producers not recovering inside the horizon. (!) **Its forecast was completed on 3 September**, before the week's rally, so its 2H2026 number sits **\$7.10** below the scored continuation and **\$11** below the active contract, both of which closed the day it published. The supply figures are the durable part: **crude production shut-ins averaged 6.7 mb/d in August against 5.0 mb/d in July**, with 5.7 mb/d forecast for Q4. (!) That is the largest month-on-month rise in the two months of this series retrieved here; earlier vintages were NOT checked, so no war superlative is claimed (\$9.32). **LANDED.** The EIA weekly retail fuel update, 9 September, for the **7 September** observation: regular \$4.157, on-highway diesel \$5.967, next release 15 September. (!) **A correction to this document's own calendar.** \$9.58 recorded Labor Day as pushing this print to 10 September. It published on the 9th for a 7 September reference date, and EIA's page carries no delay note for the cycle. The delay was real — the observation date is a federal holiday — but it was two days, not three, and the predicted date was wrong. The value matches the extract's USFRUSA cell exactly, which is the first direct primary corroboration of that series this document has published. **NOT LANDED, and this is not a retrieval failure (\$9.46).** The **Weekly Petroleum Status Report** was delayed by Labor Day to **12:00 ET on 10 September** and had not published at the Singapore cut. (!) \$9.28's import-reversion test — whether crude imports hold near 7.3 mb/d or revert toward the 6.3 four-week average — is therefore **UNRESOLVED for a SECOND consecutive cycle**. The standing print is the week ended 28 August: commercial crude **424.46 mn bbl**, SPR 286.60 mn, gasoline 205.67 mn, distillate 104.19 mn, imports 6.77 mb/d, refinery utilisation 98.0%. The **IEA Oil Market Report** for September is scheduled for **11 September**. The **OPEC MOMR** could not be retrieved at all: four probes returned HTTP 402 or served editions from 2024, so its publication status is **NOT FOUND**. **August PPI** was due at 08:30 ET on 10 September and **August CPI** falls on **Friday 11 September**, an unusual weekday. Weekly jobless claims could not be confirmed for the window and no figure is asserted. **No Fed speaking event 8–10 September was located.**

A2.3.3 · Fed pricing — a hike, into an oil shock, and three venues that cannot be joined

The market is priced for a **HIKE** and has been for a **fortnight**. CME FedWatch is reported at about 56% for a 25 bp increase as of 8 September, against about 66% on 31 August — a probability that FELL roughly ten points over the week the scored barrel rose **\$5.01**. (!) The path is attributed not to oil but to the Chair's Jackson Hole remarks of 28 August, that better-than-expected summer inflation readings 'did not demonstrate that underlying trends had meaningfully improved', and to a governor citing PCE at +3.7% year-on-year through June with core at 3.3%. **Oil is not cited as a driver in any of the coverage retrieved.** A separate prediction-market composite — a volume-weighted read across five venues — put a hold at 45.7%, a 25 bp hike at 53.9%, a larger hike at 4.5% and any cut under 1% — (!) **which sum to more than 104%**, so the five venues are not normalised to one another and these are NOT a coherent distribution, on a 3.50–3.75% range. (!) **That composite is dated 22 August and is two and a half weeks stale; it is recorded, not presented as current, and it is NOT averaged with FedWatch (\$9.19).** **The analytical point is the conjunction.** A curve whose front and belly set war highs, whose long end does not, and whose central bank is more likely than not to tighten in six days, is not pricing a supply shock as a growth shock. (!) **The obvious inference — that the market is pricing the oil move straight through into policy — is NOT drawn, because the evidence cuts against it:** the hike probability FELL ten points across the week the barrel rallied, and no retrieved coverage cites oil as a driver. The conjunction of a belly-led curve and a tightening bias is recorded; the transmission from oil to the policy path is not asserted. CPI on 11 September is what confirms or breaks it.

A2.3.4 · Treasury supply — two legs cleared, the dealer backstop halved, and the third is live today

Auction	Size and clearing	Composition, denominator named
3-year note, 8 Sep, CUSIP 91282CRL7	\$58.0bn offered, \$58.0bn accepted. High yield 4.474%, coupon 4.375%. Bid-to-cover 2.72. SOMA add-on zero	Of competitive-accepted \$57.62bn: indirect 62.15%, direct 26.94%, primary dealer 10.91%. On total award ex-SOMA: 61.74 / 26.77 / 10.84%
10-year note reopening, 9 Sep, CUSIP 91282CRF0	\$39.0bn offered, \$39.0bn accepted. High yield 4.834%, coupon 4.625%. Bid-to-cover 2.71. SOMA add-on zero	Of competitive-accepted \$38.90bn: indirect 79.18%, direct 16.51%, primary dealer 4.31% . On total award ex-SOMA: 78.98 / 16.46 / 4.30%
30-year bond reopening, 10 Sep, CUSIP 912810UW6	\$22.0bn offered, coupon 5.125%. (!) PROSPECTIVE — auctions 13:00 ET, and every result field is null in the primary API at this cut	(!) A REOPENING , and therefore NOT comparable with the \$25bn new issue of 13 August that cleared 5.216%. Read the dealer take against the ten-year's 4.31%

All figures are read from the TreasuryDirect Fiscal Data auctions API, which is the standing method (\$9.39a); TreasuryDirect's PDF endpoints return empty to a fetcher. (!) **NO TAIL IS ASSERTED FOR EITHER AUCTION.** A tail is the clearing yield less the 1pm when-issued level, Treasury publishes no when-issued level, and wire copy is not a substitute (\$9.39b). **The composition is the signal**, and it moved a long way (\$9.29). The ten-year cleared 15.1 bp above the 4.683% of 12 August, which was itself reported as the highest ten-year stop since 2007 — so this one is higher than any since at least then, stated as an inference from that reported fact rather than as a sourced superlative of its own. Bid-to-cover improved from 2.53 to 2.71 and indirects from 76.7% to 79.18%. (!) **Primary dealers took 4.31%**, against 8.6% in August. The TEN-YEAR dealer take has halved month on month, **8.6% to 4.31%**, while the yield rose. (!) No composition is published here for the 13 August 30-year, so no second auction is claimed, and the 12 August comparatives are wire-sourced with their denominator unstated. That is not a failing auction — it is the opposite, a heavily bid one — but it is a change in WHO is funding the deficit, and at a price about 15 bp worse. (!) One trap avoided and recorded: a search for ten-year auction commentary surfaced a \$39bn ten-year clearing 4.033% with a 1.3 bp stop-through. **That is the 10 September 2025 auction**, coincidentally the same size, and it is not used. Bills settled in the window: 13-week at 3.755% (cover 2.61), 26-week at 3.860% (2.88), 6-week at 3.700% (2.93) on 8 September, and 17-week at 3.865% (2.73) on the 9th.

A2.3.5 · The physical balance, and a figure that is RETIRED rather than carried

(!) **THE 0.07 MB/D EFFECTIVE OPEC SPARE-CAPACITY FIGURE IS RETIRED.** It has now failed re-verification in two consecutive cycles. No primary source supports it: the September STEO carries no spare-capacity number in mb/d on its global oil page, and the OPEC MOMR could not be retrieved at all. The nearest available figure is a third-party aggregator's rendering of EIA data showing OPEC spare capacity at 0.00 mb/d and Saudi Arabia at 0.00 mb/d for an observation month of **May 2026**, against 2.97 mb/d in May 2025, on a definition of capacity reachable within 90 days and sustainable, less actual production. (!) **That is four months stale**, TIER 2, and not the same measurement, so it neither confirms nor replaces 0.07. \$9.19 requires retraction on a FAILED re-verification — singular. (!) **It was carried once past that point, which was wrong on this document's own rule**, and it is retired now. **What survives is the qualitative claim**, which is now better evidenced than the number ever was: the STEO's own shut-in series rose from 5.0 mb/d in July to 6.7 mb/d in August. Whatever the residual cushion is, the volume already off the market grew by 1.7 mb/d in a month. **Inventories.** The standing US print, week ended 28 August, is commercial crude **424.46 mn bbl** on imports of 6.77 mb/d, and the SPR at **286.60 mn bbl**, down 3.12 mn on the prior week. (!) \$9.28's rule binds until the WPSR lands: never characterise a US weekly without the global number beside it, and check the imports line before attributing a build to fundamentals. The August IEA report is the last global read and the September one is due on the 11th.

A2.3.6 · The regional widening — corrected dates, and what is not asserted

(!) **TWO SEQUENCING CLAIMS FROM THE 9 SEPTEMBER EDITION ARE WITHDRAWN, AND BOTH ARE DATES.** First: this document published 'no acknowledged US strike on Iranian SOIL from 1 September through 8 September, an eighth day'. US forces struck Iranian radars on **1 September**; the President confirmed it on the record that day and CENTCOM connected the strikes to IRGC attempts on commercial shipping. The window was wrong at its opening. **Corrected: 2 September through 9 September**, eight days — the same count, shifted one, and the 9th is now ON the record rather than uncounted, because a conflict log and a TIER 2 wire independently report no coalition strike on Iranian soil that day. **10 September is unreported at the cut and is NOT counted.** (!) The claim is bounded to SOIL and EXCLUDES strikes on vessels in Iranian territorial waters, of which there were at least two near Kharg Island, on 5 and 8 September. Second: this document said Saudi Arabia struck **Taiz and Marib in reply** to the 8 September barrage. The source dates the Saudi strikes on **al-Jawf, al-Bayda, Marib and Taiz** to the day BEFORE it, with a reported strike on a prison at al-Hazm killing seven. **They preceded the barrage**; they did not answer it. A Saudi response was promised in the words 'all necessary measures and actions to respond to the sources of the threat', and **no retaliatory target or date has been sourced. What happened, dated.** On **8 September** the Houthis — announced by their military spokesman, and **NOT attributed to Iranian direction by any source retrieved** — struck **Abha, Khamis Mushait, Jizan and Najran** with drones and ballistic missiles, wounding at least 73. The **Jizan refinery, 400,000 b/d**, was affected. (!) **It was ALREADY offline from earlier attacks**, so NO incremental barrel loss is asserted, and no restart date has been published. Overnight on **8–9 September** the IRGC fired 20 ballistic missiles at **Al-Azraq air base in Jordan**; Jordan reports 18 intercepted and two down in unpopulated ground, with no casualties. **That is a fourth country taking fire and it is the substantive widening of this window.** Iran also attacked ten vessels near the strait and claims hits on two US destroyers by hull number (TIER 3 state media: uncorroborated, and no allied product names either ship). On **9 September** the IAEA Board referred Iran to the UN Security Council, reported as the first such referral in twenty years. (!) **The vote count is NOT FOUND** and none is asserted.

A2.3.7 · The absences that are findings

Each of these is a negative that has been probed, and each is stated with its method (\$9.23, \$9.64). **No CENTCOM release dated 9 or 10 September.** Probed four ways: the paginated press-release index, the by-year path, the PUBLIC-RELEASES path where the article URLs actually resolve, and **DVIDS, an entirely independent host.** All four return 8 September as the newest item. (!) **The pagination parameter is now known to be IGNORED on that index**—page 2 returned content identical to page 0 — so pagination is NOT a valid second probe on this site, and the negative rests on the other three. The CENTCOM RSS endpoint returned a channel with zero items and is useless in either direction. That is the direct methodological legacy of \$9.64, applied one week after the failure that produced it. **No Omani text on the strait.** fm.gov.om published on 9 September — a call with the UN Secretary-General on 'regional developments and their humanitarian repercussions' — naming neither Hormuz, nor Iran, nor a corridor, nor the IMO, and on the 8th condemning the attacks on Saudi Arabia while calling for the protection of maritime navigation in general terms. Method: the news and statements indexes read directly, asked for any Hormuz, Iran, navigation or mediation item. **A FOURTH consecutive edition with no counterparty text. No IMO record.** Checked directly this edition: the IMO's own Middle East and Strait of Hormuz page carries no entry after **13 April** and no Iranian submission, corridor notification or exclusion-zone reference. (!) Its confirmed-incidents page is disallowed by robots and is **NOT OBTAINED. No Swiss protecting-power movement and no statement by the Iranian President**, the Supreme Leader, the Foreign Minister, Khatam al-Anbiya or the PGSA in the 8–10 September window; the only Iranian principals speaking are the foreign-ministry spokesman and the IRGC. **No allied corroboration of the five-tanker claim**, because the adjudicating product closes before it. **No 10 September NEWS event on any military or diplomatic track:** that record closes at 9 September, which is consistent with a same-day edition and is stated as a gap rather than as quiet. (!) The shipping and market rows DO carry 10 September readings, and every probe above was run on the 10th.

A7 · SOURCE LOG

Every claim in the edition and this annex traces to a row below. **TIER 1** is a primary or official publisher, including a party to the conflict publishing about itself. **TIER 2** is established wire or trade press. **TIER 3** is state media or an unverified aggregator, and is never used alone for anything market-moving. **NOT OBTAINED** means sought and missed; **PROSPECTIVE** means the session or publication had not occurred at the Singapore cut and is not a retrieval failure (\$9.46).

A7.1 · Tier 1 — market and official data

Source	Used for	Date and state
Bloomberg extract, <i>US Iran BBG Data.xlsx</i>	Every scored series, the pre-war anchor and all deltas. 180 rows × 99 columns; columns resolved by header scan	Refreshed 10 Sep. Latest row 10 Sep intraday; latest full close 9 Sep
TreasuryDirect Fiscal Data auctions API	3-year, 10-year and 30-year auction internals; four bill auctions. Allotment shares on both denominators	9–10 Sep. 30-year fields null — PROSPECTIVE
EIA Short-Term Energy Outlook	Brent path 2H2026–2H2027; crude shut-in volumes 6.7 mb/d August against 5.0 July; recovery horizon	Published 9 Sep; forecast completed 3 Sep
EIA Gasoline and Diesel Fuel Update	US regular \$4.157 and on-highway diesel \$5.967 — the USRFRUSA corroboration	Published 9 Sep for the 7 Sep observation
EIA Weekly Petroleum Status Report	Crude, SPR, product stocks, imports, utilisation. Standing print is the week ended 28 Aug	(!) Delayed to 12:00 ET 10 Sep — PROSPECTIVE
AAA national averages	Regular \$4.2245 and diesel \$5.9424 for 9 Sep; the \$5.0165 regular record of 14 June 2022	Read direct 10 Sep. (!) The \$5.9015 diesel figure for 7 Sep could NOT be re-verified
US CENTCOM	The 8 Sep five-tanker release with five named vessels; the 1 Sep strikes on Iranian radars	Probed four ways 10 Sep. No release dated 9 or 10 Sep
JMIC Update 094, hosted on ukmt.o.org	Hormuz SEVERE; the 30 nm standoff; the three vessels named for 5 Sep; the 138/day 2025 baseline	Cut 051500Z. 095 NOT OBTAINED , four probes
fm.gov.om and imo.org	The 9 Sep UN call; the 8 Sep Saudi condemnation; the 25 Aug joint statement; the empty IMO Hormuz record	Read direct 10 Sep. IMO incidents page robots-blocked — NOT OBTAINED
OPEC Monthly Oil Market Report	September balance revisions and spare capacity	(!) NOT FOUND — four probes returned HTTP 402 or 2024 editions

A7.2 · Tier 2 — wire, trade press and named data providers

Source	Used for	Date
Al Jazeera	The 8 Sep Houthi attacks and the 73 wounded; the Saudi strikes dated the day before; the Jordan missile attack; the IAEA referral; Qatar's reopening statement and the Beijing meeting; the 9 Sep clean-soil reading	8–9 Sep
GlobalSecurity conflict log	Day 193 and 194 records of no coalition strike on Iranian soil; the 9 Sep CENTCOM blockade tally; the Secretary of State quotation	8–9 Sep
Kpler, Windward, TankerMap, Lloyd's List Intelligence	Four independent transit universes with their own denominators, tabled at A1.4 and never spliced	7–10 Sep
CME FedWatch via wire coverage	The ~56% September hike probability for 8 Sep and the ~66% of 31 Aug	8 Sep
TradingEconomics and market commentary	Attributed drivers of the 9 Sep crude rally; the TTF and Henry Hub context; EU storage near 66%	9–10 Sep
Marsh via trade press	War-risk premiums with an explicit hull-value denominator — the only such basis available	(!) Dated 23 July ; no current-window equivalent
USNI and TWZ fleet trackers	Two carrier strike groups in theatre and no rotation change in the window	8–9 Sep
ISW / Critical Threats	Confirmation that US forces struck Iranian radars on 1 September — the basis of this edition's withdrawal	1 Sep, re-read 10 Sep

A7.3 · Tier 3, and the sources struck from the log

TIER 3, carried but never load-bearing. Iranian state media and Sepah News, for the SNSC secretary's claim that maps are agreed and will be signed within days, the foreign ministry's claim of an IMO filing within days, and the IRGC's claims of hits on two named US destroyers and the capture of a sea drone. **None is corroborated by any TIER 1 or TIER 2 product and none moves a channel or a probability.** The straits.live dashboard, for ambient AIS counts, the dark-tanker series and the war-risk multiple: its transit figure is unrefreshed since 30 August and its bypass-pipeline table is an explicitly editorial estimate roughly four months old. (!) **STRUCK FROM THE LOG THIS EDITION:** jmic.online. It is not the Joint Maritime Information Center; it is an unrelated academic journal, and treating it as the JMIC address is the likely root of three editions of failed retrieval. **JMIC products are published on ukmta.org.** (!) **DISCARDED THIS EDITION:** an outlet whose headline asserted that Iran had filed the Oman corridor with the IMO, because **its own body text states that no filing had been reported** — a headline that contradicts its own article is not a source (§9.59b). (!) **NOT USED:** a ten-year auction report showing a \$39bn clearing at 4.033% with a 1.3 bp stop-through, which is the **10 September 2025** auction and coincidentally the same size. **Unreachable, and named so rather than worked around:** Bloomberg articles (robots-disallowed, headlines only), one CNBC and one Washington Times piece (HTTP 403), the IMO confirmed-incidents page (robots-disallowed), UKMTA's own incident and advisory indexes (JavaScript shells that render empty), and the EIA API v2 (rate-limited).

A8 · ON-DEMAND UPDATE PROTOCOL

	Step	What it produces, and what went wrong when it was skipped
1	Parse the refreshed extract by HEADER SCAN, never by column index	Resolves CO2/CL2 and COA/CLA, the twenty scored series and the 27 February anchor. The 6 July relabelling of CO1/CL1 and the 3 August change in the dollar ticker were absorbed without a code change. (!) Never build an edition off a stale extract — check the file's save time AND the latest row, which are different failures (§9.22)
2	Run all THREE standing integrity checks, then reconcile	(a) §9.8, row-level: did the prior row refresh at all? (b) §9.35, field-level: is any field identical to four decimals, in which case it is UNRESOLVED and no d/d is asserted, whatever the state of the row around it. (c) §9.41, basis: does any continuation series show a sign change or a step against its active contract? (!) Add the §9.60 field-by-field diff against the last edition's PUBLISHED figures, recording three outcomes: settled, carried, LOST
3	Compute deltas, trigger distances and a full-column superlative sweep	d/d against the last confirmed close, w/w five sheet-rows back, and versus the 27 February anchor. (!) Every superlative is checked against the WHOLE column before it is written, not after (§9.32) — this edition, that sweep is what established that the 2-, 5- and 10-year set war highs and the 20- and 30-year did not
4	Verify the news on two parallel tracks, and re-verify what was inherited	Military and diplomatic on one, shipping, energy and macro on the other, each told to answer NOT FOUND rather than estimate. (!) A negative claim is a claim about the SOURCE and must be probed a SECOND, different way before publication (§9.23, §9.64). Inherited claims, superlatives and series DESCRIPTIONS are re-verified on the same schedule as new ones (§9.13, §9.32, §9.57)
5	Score on CONFIRMED CLOSES ONLY, with hysteresis, then QA in four passes	No market channel moves on an intraday print; upgrades need a sustained break, downgrades a sustained reversal past a wider level. (!) QA is numeric, then STYLE, then TWO adversarial prose reviewers run CONCURRENTLY against the same pre-fix text with no access to the source data , merged and applied in one pass, then a VISUAL render (§9.34, §9.38, §9.59, §9.62)

A9 · METHODOLOGY

A9.1 · The engine, and what a flat score does and does not mean

Six channels, each scored 0–5 and summed to 0–30. Bands: 0–7 watch, 8–14 stress, 15–21 systemic-risk watch, **22–30 crisis**. Maritime denial and escalation risk are EVENT channels and carry their own as-of dates; oil, US inflation, Treasury stress and political stress are MARKET channels and move only on confirmed closes. **Five of six channels have been at the ceiling since 4 August**, so the total cannot register further deterioration in five of the six dimensions it measures (§9.7). It equally cannot register improvement (§9.27). (!) **This edition is the first in a long run where the caveat bites in ONE direction only.** The scale is still hiding a great deal — a war that widened to Jordan, two gas records, three war-high yields — but the one channel with room is the one being tested: the oil channel sits one confirmed close from firing, and a move there would take the total to 28/30 on market data alone. Where the scale is saturated, read the composition and not the total.

A9.2 · The two disciplines that decide this edition

(a) **Confirmed closes only**, and sustained means more than one. The oil channel held at 3 on 2 July through a sub-pre-war INTRADAY and was cut to 2 only on the second confirmed close, on 3 July. The US-inflation channel held at 3 on 14 July on a 0.6 bp margin because the trigger says sustained, and fired on 15 July on the second consecutive close. An oil downgrade taken on 25 June had to be reversed on the 26th. (!) **That rule, and nothing else**, is what holds this edition at 27/30. The scored continuation closed \$97.10 on 9 September, \$2.10 through the \$95 upgrade level; that is ONE close. A second fires 2→3. (b) **Hysteresis**. Upgrades fire on a sustained break; downgrades require a sustained reversal past a WIDER threshold. This is why Treasury stress holds at 5 with MOVE below its trigger for two sessions in early August and why political stress held at 5 through a six-session gasoline decline that reversed completely on two backfills. (!) (c) **The rule is never moved to fit the tape**. The US-inflation downgrade sits 17.46 bp below the level whose break fired the channel, and that gap is reported rather than closed (\$9.16, \$9.26). The same discipline forbids re-basing the oil trigger onto whichever Brent series would fire it (\$9.56b).

A9.3 · \$9.56 — the trigger level inside the basis, and how it resolved

(!) **This paragraph is rewritten this edition and describes 9 September, not any earlier session**. \$9.56 was written on 2 September, when the Brent roll of 31 August had opened a continuation-to-active basis of \$3.63 and the \$95 trigger level had landed INSIDE it: the continuation sat below the level while the active sat above it, so the rule as written had two defensible readings giving OPPOSITE answers, and nothing in its own text chose between them. The practice adopted then was to hold the channel on the SCORED CONTINUATION, publish the alternative reading rather than suppress it, and refuse to move the rule. **On 9 September the undefined region closed from the other side**. The continuation closed \$97.10 and the active \$101.21; the basis is \$4.11 and widening, but the trigger level now sits BELOW both series, so the two readings AGREE. **The rule was not moved and did not need to be**. (!) \$9.56c required the problem to be disclosed BEFORE it went live rather than after, so that the decision would not be taken under the pressure of a fired trigger. It was disclosed on 2 September, seven days early, and the general form it warned of stands unchanged for the next roll: **any threshold expressed as an absolute level on a rolling series has an undefined region as wide as the basis**. (!) That region has narrowed in effect but is NOT closed: the continuation reading has one close and the active reading six, so the two still give opposite scoring answers.

A9.4 · Integrity rules, and what each one ACTUALLY tests

(!) **An integrity rule written for a failure mode you have seen will not fire on one you have not**, so each is stated by what it tests rather than by what it is for. \$9.8 tests whether the PRIOR ROW failed to refresh at all — symptom, a zero gap on every field. It CLEARS this edition: eighteen fields moved on the 9 September row. \$9.35 tests whether a single FIELD is identical to four decimal places to its predecessor, in which case it is UNRESOLVED and no day-on-day change may be asserted, **regardless of whether the row around it is live**. It CLEARS on the 8th, 9th and 10th — no such field on any of the three. The rule exists because on 17 August a 30-year identical to four decimals in an otherwise live row was published as genuine and concealed a new war high. (!) Its precision is per series: on a four-decimal yield an exact repeat is strong evidence of a carry, while on a two-decimal retail price it is close to a coin flip (\$9.48). \$9.41 tests every continuation against its active contract for a SIGN CHANGE or a STEP. It CLEARS: both bases widened smoothly. (!) **A NEW STANDING CHECK IS ADDED THIS EDITION**. A series that LOOKS derived must be tested against its own components before it is called derived: **USYC2Y10 does NOT equal the ten-year less the two-year on any of the 179 rows in this extract**, mean absolute difference **0.40 bp**, so the 'consistent by construction' line this document carried for months is WITHDRAWN and the 2s10s counts as an independent observation. \$9.60 tests, field by field, whether a cell the last edition PUBLISHED has since gone blank — the case both row-level rules assume cannot happen. It has FIRED for three consecutive extracts on the 7 September WTI, active-WTI and Henry Hub cells. A lost cell yields no close, so no d/d and no reconciliation entry, and the correct form of words is that the values existed and are gone, not that they were never there. \$9.37 forbids computing a reconciliation gap against any field published as a carry, a restatement or a loss, because such a gap measures the extract rather than the timing of the cut. (!) It excluded the five-year this edition; that field settled **5.36 bp** from its repeat, the second largest rate figure the table would have carried.

A9.5 · Denominators, negatives, and the two withdrawals in this edition

Never quote a percentage of normal without naming the baseline (\$9.19). Four Hormuz baselines are in circulation this week — **85, 100, 130 and 138** vessels a day — and three providers dividing three different numerators by three different bases report 7%, 8.5% and 14% — neither term common — so the maritime downgrade test is run solely where one provider supplies both numerator and baseline. The same rule governs auction allotments: every share here is stated on the COMPETITIVE-ACCEPTED denominator with the total-award-ex-SOMA figure beside it (\$9.40). **A negative claim is a claim about the SOURCE**, and an INDEX is not the SOURCE (\$9.23, \$9.64). On 9 September this document read centcom.mil's index directly, found nothing after 5 September, and published a false negative because the listing served stale content. The remedy is applied here: every load-bearing negative was probed a second and third way, and where that was impossible it is published as **NOT OBTAINED** with the method stated rather than as an absence. (!) The pagination parameter that failed then is now known to be IGNORED on that site, so it does not count as a probe; an independent host does. **Two claims are WITHDRAWN this edition and both are DATES INSIDE A WINDOW**. The kinetic count was published as beginning on 1 September, the day US forces struck Iranian radars; corrected to **2 through 9 September**. And the Saudi strikes on Taiz and Marib were published as a reply to the 8 September barrage when the source dates them to the day before it. (!) **A window is a figure** (\$9.65): a date inside a methodology or narrative sentence is exactly as suspect as a number in a table, and the numeric harness cannot see it.

A9.6 · Restatements, comparability, and the open items carried forward

Vendor restatements are normal and make absolute levels non-comparable with pre-restatement editions, though directional analysis is continuous; a roll does the same thing silently to a continuation series (\$9.36). **No restatement was detected in this extract. OPEN ITEMS, each stated rather than quietly carried**. (i) **Whether the oil channel should be scored on the continuation or the active contract** remains open, and this edition does not settle it — both readings now agree, which is precisely why it is a safe moment to leave the question alone rather than to decide it. (ii) **The AUTMUSAG description is WITHDRAWN and unreplaced**: the vendor label is only 'US Average Gasoline Price', it does not reconcile to AAA on the same date, and its spread to the DOE series has now widened for nine consecutive observations to a war record of **77.3 cents**. The series is not re-based on the edition that discovers this (\$9.21, \$9.56b). (iii) **Whether the political channel should read a distillate series** is a SCOPE question. AAA diesel setting a fresh all-time high on 9 September makes it more pressing; it does NOT reopen it here, and it stays open (\$9.61). (iv) **The Asia LNG assessment provider could not be identified** from public material, which is a \$9.57-class question about a description, not a doubt about a continuous series. (v) **Stage-4 Threshold A is untestable as written** and is reported in that form rather than as 'does not arm', because Treasury publishes no when-issued level and a tail is therefore not computable from primary data (\$9.33, \$9.39). (vi) **The 0.07 mb/d spare-capacity figure is RETIRED** after two failed re-verifications, rather than carried a third time (\$9.19).

A10 · ANCHOR AND TRIGGER LEVELS

A10.1 · Pre-war anchor — 27 February 2026 close (USFRUSA weekly, 23 February), re-verified field by field this edition, unchanged

Field	Anchor	Latest close	Change	Field	Anchor	Latest close	Change
Brent CO2	72.48	97.10	+33.97%	2s10s	55.64	40.691	-14.95 bp
Brent COA	70.88	101.21	+42.79%	10y breakeven	2.2569	2.3879	+13.10 bp
WTI CL2	67.02	92.87	+38.57%	5y5y forward	2.142	2.3166	+17.46 bp
WTI CLA	66.18	96.05	+45.13%	MOVE	73.38	76.74	+3.36
Henry Hub	3.063	2.822	-7.87%	VIX	19.86	16.46	-3.40
TTF	31.227	79.246	+153.8%	SOFR	3.68	3.64 (8 Sep)	-0.04
Asia LNG	1,669	4,115	+146.6%	Dollar index	97.608	98.817	+1.24%
2-year	3.3749	4.4295	+105.46 bp	Gasoline AUTMUSAG	3.52	5.00 (8 Sep)	+42.0%
5-year	3.5017	4.6163	+111.46 bp	Gasoline DOE, 23 Feb	-2.94	4.157 (7 Sep)	~+41%
10-year	3.9375	4.8406	+90.31 bp	20-year, unscored	4.5505	5.2908	+74.03 bp
30-year	4.6106	5.2889	+67.83 bp				

(!) **Four series close BELOW their pre-war anchors:** Henry Hub, the 2s10s spread, the VIX and SOFR. Henry Hub is the only ENERGY series among them, and that is the load-bearing evidence that this is a routing and loading shock rather than a global one. (!) **Three tenors set new war-high closes on 9 September — the 2-, 5- and 10-year —** and two did not: the 20-year and the 30-year remain below their 17 August peaks of 5.3016% and 5.3060%. Dates are given in-cell where a series has not resolved to 9 September. (!) Change units follow the field: per cent for prices, basis points for yields and spreads, index points for MOVE and the VIX.

A10.2 · Live trigger state — every channel on the 9 September close, with events to 10 September

Channel	Upgrade	Downgrade	Live distance
Maritime denial — 5	At the cap	Verified reopening AND traffic above 25% of normal for ten sessions	No reopening verified by any provider. Traffic under 9% on Kpler's own base, about 14% on JMIC's. (!) Both legs unmet, and no baseline is agreed
Oil price shock — 2	Brent CO2 above \$95 sustained → 3	A mediated pause AND a close at or below \$72.48 → 1	(!) ONE confirmed close: \$97.10 , \$2.10 THROUGH the level. Active \$101.21, \$6.21 through. A SECOND close fires 2→3 . The 10 Sep mark is \$97.00, session low \$96.96. Downgrade \$24.62 away and both its legs unmet
US inflation impulse — 5	At the cap	5y5y sustained at or below the 2.142% anchor → 4	17.46 bp above the anchor, from 16.99 — further away. A SIXTH close above the 2.30% firing level, clearing by 1.66 bp, the widest of the run. BE10 13.10 bp above its own anchor
Treasury stress — 5	At the cap	30-year below 5.00% WITH MOVE below 75, sustained → 4	(!) Both legs failed and both widened . Yield leg fails by 28.89 bp, from 24.54. Volatility leg fails by 1.74, from 1.14, on a SECOND close above 75. \$9.15's rotation does not apply — nothing rotated
Political stress — 5	At the cap	Three consecutive AUTMUSAG closes at or below \$4.60 with no intervening print above \$4.70 → 4	40 cents above the condition on a \$5.00 print, from 33 — further away, and the condition needs three such closes. 9 and 10 Sep are blank
Escalation risk — 5	At the cap	A mediated stand-down WITH talks resumed → 4-3	No convened talks and no counterparty text for a fourth edition. (!) Against a downgrade: a fourth country struck. The only live thread is Qatari and Chinese

A10.3 · Stage-4 thresholds — levels and live margins

A — an auction clearing with a tail above its when-issued level. NOT ARMED, UNTESTABLE AS WRITTEN. Stated in the \$9.39 form because the test cannot discriminate between states, not because it ran and failed: Treasury publishes no when-issued level, so no tail is computable from primary data and wire copy is not a substitute. (!) The reference point has moved and is recorded as history rather than quoted as a live distance: the US has now term-funded at 5.216% (13 August), so the 5.050% May stop is a historical marker. The \$22bn 30-year REOPENING of 10 September is **PROSPECTIVE** at this cut and is not comparable with that **\$25bn** new issue. **B — the 30-year above 5.20% WITH the 10-year above 4.65%.** ARMED, and the run EXTENDS to an EIGHTH close on a single arming: 28 and 31 August, then 1, 2, 3, 4, 8 and 9 September, with 7 September excluded because a shut market wrote no close (\$9.58). (!) **Both legs cleared by the widest margins of this arming:** the long leg by 8.89 bp, from 4.54, and the ten-year leg by 19.06 bp, from 13.82. The long-leg clearance sequence reads **0.56, 4.23, 7.30, 5.71, 4.65, 4.23, 4.54, 8.89**. (!) **This is the first evidence AGAINST this document's own standing reading of B.** After five in-and-out cycles each decided by under 6 bp, the conclusion drawn was that **4.65%** and **5.20%** are the middle of the distribution rather than its edge. Eight consecutive closes, ending in a one-session jump to the widest margin of the arming, is not that — (!) though the sequence itself is NOT monotone, and and it is recorded as a challenge to the reading rather than absorbed into it. **C — MOVE above 130. NOT ARMED:** 76.74, some 53.26 points below, against a war high of 115.02 set on 26 March and a war low of 65.39 set on 18 June. (!) The informative figure is the direction rather than the distance: MOVE has closed above its 73.38 pre-war anchor for a second session while the 30-year sits 67.83 bp above its own. Through August the pairing was the opposite — a normalised expectation of movement around a yield that had not normalised at all — and that divergence is now closing from the volatility side, which is the less reassuring of the two ways it could close.
