

ANNEX · 8 SEPTEMBER 2026

This annex is the companion to the 8 September 2026 edition and is built every day. The edition is capped at eight pages; material is RELOCATED here, never deleted. Section numbering tracks the edition: A1 carries the full commentary for the live-tape tables and the gasoline chart, the full strait-operational record and the freight and war-risk record; A2.3 the full cross-asset and macro record, the war-powers schedule and the SPR withdrawal; A7 the source log; A8 the on-demand update protocol; A9 the methodology; A10 the anchor and trigger levels. A figure marked NOT OBTAINED — or, equivalently, NOT FOUND — was sought and missed, and is absent from the record rather than unchanged. A figure marked PROSPECTIVE relates to a session or publication that had not occurred at the Singapore cut and is not a retrieval failure (\$9.46).

A1 · LIVE TAPE — FULL COMMENTARY

A1.1 · Data integrity — \$9.41 CLEARS; \$9.35 FIRES on two rows; \$9.8 FIRES IN A NEW FORM

\$9.8, the ROW-level check: FIRES, and it fires in a form this document has not recorded before. The test asks whether the prior row refreshed. Part of it did. The 7 September row now carries genuine settlements for the series that traded on a US federal holiday — Brent CO2 at 93.16 against a published mark of 92.72, COA at 97.00 against 96.69, TTF at 73.306 against 74.855 and Asia LNG at 4,010 into a blank cell. But THREE fields the last edition published as 7 September marks are now BLANK: WTI CL2 at 88.96, CLA at 91.95 and Henry Hub at 2.929. The row did not fail to refresh and it was not backfilled. It LOST values it had already carried. \$9.8 was written for a row that never updated and \$9.10 for one that fills in later; neither anticipates a row that REGRESSES, and that gap is recorded as NEW PITFALL \$9.60. The remedy follows the existing rules rather than inventing one: there is no 7 September close for those three, no day-on-day change is asserted, the next comparison runs 4→8 September, and no reconciliation entry is made for them, because a reconciliation gap is a published mark minus a settled close and there is no settled close (\$9.37).

\$9.35, the FIELD-level identical-value check: FIRES ON BOTH ROWS, and for two different reasons. On the 7 September row the 2-year (4.3661), 5-year (4.5448), 10-year (4.7821), 20-year (5.2469), 30-year (5.2423), the 2s10s (41.394) and the DOLLAR INDEX (99.176) are ALL identical to four decimal places to their 4 September closes. The cause is known and was published in advance: 7 September was US Labor Day and the cash bond market was shut. \$9.58, written last edition, holds that a known and benign cause earns no exemption, and the remedy is applied on the cell's evidence: UNRESOLVED, no d/d, no reconciliation entry. (!) The DOLLAR INDEX is the addition this edition and it matters, because the last edition published 99.139 as its 7 September mark and the cell now reads 99.176 — which looks like a settle and is a CARRY of the 4 September close. Computing a +0.037 'gap' on it would have measured staleness, not the timing of the Singapore cut, which is the precise error \$9.37 forbids. It is excluded from A1.2 by name. (!) BE10 (2.3536 vs 2.3532), the 5y5y (2.3032 vs 2.3082) and the VIX (15.30 vs 14.53) DID move on that row and are carried UNRESOLVED as well, under \$9.58c: a derived generic cannot settle on a shut cash market and a volatility index cannot settle on a shut options exchange. The VIX is the sharpest instance: a value appeared for a session that did not exist.

\$9.35 fires a SECOND time, on the 8 September row, and this one is the pure case. BE10 prints 2.3536, identical to four decimal places to the 7 September cell, in a row where every nominal tenor moved and the 2s10s moved 0.250 bp. That is the exact configuration that concealed a 30-year war high on 17 August and caused \$9.25 to be replaced. It is carried UNRESOLVED; no d/d is asserted; its last RESOLVED value is the 4 September close of 2.3532%. (!) \$9.48 requires the precision to be stated: BE10 is a four-decimal derived generic, so an exact repeat carries real improbability and the test discriminates well here — unlike AUTMUSAG, a two-decimal retail price on which an exact repeat is close to a coin flip. (!) And the corroboration cuts the same way rather than against it: an independent Treasury par-curve read has the 10-year breakeven flat at 2.35% on 1, 2, 3 and 4 September. That is TWO decimals and cannot separate 2.3532 from 2.3536, so it is quoted for DIRECTION only and does not resolve the cell. The honest composite statement is that the market's ten-year inflation compensation did not move materially through this window, and that this document's own cell cannot say by how much.

\$9.41, the BASIS check: CLEARS, for a sixth consecutive edition. The Brent continuation-to-active basis printed 0.00 through 28 August, then 2.12, 3.08, 3.54, 3.89, 3.96, 3.84 and 3.88 across 31 August to 8 September — one step off zero at the roll, four decelerating widenings, then a narrowing and a part-retrace. No second step, no sign change. WTI's independent basis has no 7 September value at all and ran 2.91 on 4 September to 3.07 on the 8 September mark, a widening, while Brent's narrowed across the same span. (!) Two contracts moving opposite ways over one span, for a second consecutive edition, is an argument against reading either basis as a market signal. The corollary is unchanged and is the largest open methodological item in this document: the \$95 trigger sits BETWEEN the two Brent series for a fourth consecutive close, and \$9.36 forbids constructing anything across the boundary. It is stated at \$2.1 and \$9.56 and is NOT resolved here. No new restatement was found: the 3 and 4 September closes reconcile field by field against what the last two editions published for them on every scored series.

\$9.10, the two-way BACKFILL test: fires on ONE cell and it is upward again. AUTMUSAG's 4 September cell, reported dark last edition, has printed at \$4.93 — one cent above the \$4.92 carried as last resolved, a FIFTH consecutive rise and the highest print since 29 May. (!) The last edition described \$4.92 as a fifth consecutive rise; the run begins at \$4.81 on 28 August, so \$4.92 is the FOURTH and the ordinal is CORRECTED (\$9.32). It is NOT a war high: \$5.18 of 20 May stands (\$9.32). The political channel's distance to its downgrade widened again, to 33 cents from 32. (!) \$9.10 has now fired UPWARD on the scored gasoline series in FIVE consecutive editions — \$4.83, \$4.86, \$4.90, \$4.92, \$4.93 — against a downgrade case that was live three weeks ago. That is why \$9.30 forbids reading a trend through dark cells: every cell that has filled has run AGAINST the direction the dark ones seemed to suggest. SOFR did NOT backfill and is dark for a third session, 4, 7 and 8 September.

A1.2 · Reconciliation of the 7 September snapshot — a partial reconciliation, with the exclusions published

This is the shortest reconciliation table this document has published, and the reason is the point. Of the fourteen tape fields normally reconciled, only FOUR can be: the rest either have no 7 September close because the market was shut, or lost the value they had. Every exclusion is named rather than done silently (\$9.37). EXCLUDED because no close exists on a shut market: the 2-, 5-, 10-, 20- and 30-year, the 2s10s, BE10, the 5y5y, the VIX and the DOLLAR INDEX — ten fields, of which the dollar is the one that would have looked reconcilable and is a carry. EXCLUDED under new pitfall \$9.60 because the extract lost the cell: WTI CL2, CLA and Henry Hub. (!) The four that remain traded on a US holiday because they are not US cash instruments, and the reconciliation they give is small and one-directional: THREE of four settled ABOVE the mark and one BELOW, the exception being the one that matters most for a superlative.

Field	Published 7 Sep snapshot	7 Sep settled close	Gap
Brent CO2	92.72	93.16	+\$0.44 — and it is the difference between an upgrade \$2.28 away and one \$1.84 away. The snapshot UNDERSTATED the scored channel for a second consecutive edition
Brent COA (active)	96.69	97.00	+\$0.31 — MEASURED, both sides post-roll. (!) It settled through \$95 for a FOURTH consecutive close, so the finding does not depend on the snapshot in any way
TTF	74.855	73.306	−€1.549 — THE ONE THAT VINDICATES \$9.1. The mark was ABOVE the €73.634 war-record close and the last edition claimed NOTHING on it. It settled €0.328 BELOW that record. Had the mark been published as a record, the record would have been withdrawn within a day
Asia LNG	no print	4,010	(!) NOT a gap but a BACKFILL, and this one arrives ABOVE the record: +81 on the ¥3,960 of 3 September, making it the THIRTEENTH war-record close and the first print of this war above ¥4,000 (\$9.10)
DXY	99.139	EXCLUDED	(!) The cell reads 99.176, IDENTICAL to the 4 September close. A +0.037 gap would measure STALENESS, not the timing of the cut. Excluded by name (\$9.35, \$9.37)
WTI CL2 / CLA / Henry Hub	88.96 / 91.95 / 2.929	EXCLUDED	(!) All three cells are BLANK in this extract, having carried values in the last one. There is no close to reconcile against — new pitfall \$9.60
Whole rate block	carried unresolved	EXCLUDED	Ten fields. The cash bond market and the options exchange were both shut for Labor Day; no 7 September close exists for any of them (\$9.58)

WITHDRAWALS AND CORRECTIONS THIS EDITION. **Three, and all three come from RE-VERIFICATION rather than from news, which is \$9.13 working as intended.** (a) **WITHDRAWN:** 'no VLCC has exited the strait since 2 September'. Kpler said that of its VISIBLE commodity-vessel universe and it remains true of it; Windward's own AIS-plus-dark log records a 340-metre VLCC-class tanker outbound on 4 September, dark, at reduced speed and trailing a 16km surface sheen. A dark hull cannot appear in a visible count, so the two providers are reconcilable and the UNQUALIFIED form was wrong. Re-issued as *no VISIBLE VLCC exit since 2 September* (\$9.19). (b) **CORRECTED:** the enlarged long-end buyback does NOT begin on 9 September. The last edition said it did, twice. Treasury's own tentative schedule has 9 September as a CASH-MANAGEMENT operation in nominal coupons 1Mo–2Y for up to **\$12.5bn**, and the 10Y–20Y liquidity-support operation on 10 September. The press release announcing the increase says 'effective September 9', which is consistent only if it refers to the ANNOUNCEMENT date of the 10 September operation. Both readings are published and neither is resolved. (c) **CORRECTED:** the delayed EIA retail print is 9 September, not 10. EIA's own holiday schedule moves the retail print to Wednesday and the WPSR to Thursday; the last edition merged two delays of different lengths. (!) **TWO FURTHER ITEMS ARE DOWNGRADED RATHER THAN WITHDRAWN.** The CME hike-odds pair **48.4% → 58.4%** could not be re-verified against any source reached on this pass; the decimals are **WITHDRAWN** and the direction survives on relays reading about **52%** (4 Sep) and **59%** (5 Sep), never spliced (\$9.24). And AAA no longer displays the superseded 2022 diesel record, so its 19 June 2022 date is no longer assertable from AAA and this document carries only the level; the **\$5.8819** published for 5 September could not be independently re-verified and is carried as single-source.

A1.3 · Energy, gas and the physical record — full commentary

Brent CO2 closed **\$93.16**, **+\$0.84**, leaving the **\$95** upgrade **\$1.84** away. The edition-over-edition sequence is 9.78, 8.43, 5.55, 5.21, 3.03, 7.73, 8.06, 6.48, 6.90, 6.63, 3.43, 2.91, 3.37, 2.68, 1.84 — FIFTEEN readings, and **\$1.84** is the narrowest of them. (!) Bound it against the SERIES rather than against this document's reading history (\$9.32). Across the whole war the scored continuation has closed nearer the level than this on eight occasions, the nearest being **\$94.98** on 1 June, two cents away; but every one of those sits before 24 July, the last session on which CO2 closed ABOVE **\$95**. The precise and defensible form is therefore: **\$1.84** is the nearest this series has closed to its trigger since it was last above it, and the July readings of **\$0.93** and better sit on the far side of a roll on which the active contract never cleared the trigger (\$9.36). The downgrade leg is **\$20.68** above **\$72.48**. (!) WTI has no 7 September close at all (\$9.60), so no scored crude corroboration is available for the session and none is manufactured.

THE ACTIVE CONTRACT HAS CLOSED THROUGH **\$95** FOUR TIMES IN SUCCESSION AND THE SCORED SERIES HALVED ITS DISTANCE IN THREE SESSIONS. COA settled **\$95.63**, **\$95.52**, **\$96.28** and **\$97.00**; CO2 settled **\$92.09**, **\$91.63**, **\$92.32** and **\$93.16**. **Two consecutive closes is the specific test that fired US-inflation 4→5 on 31 July and cut oil 2→1 on 3 July, and on both occasions this document refused to act on the first close alone.** Four closes is far past it. (!) Bound the superlatives before writing them (\$9.32). **\$97.00** is the highest active close since 22 May, when COA settled **\$100.21**; it is the TWENTY-SEVENTH COA close above **\$95** in this war, from twenty-six; and it is the first RUN of four since a twenty-close run ended on 22 May. (!) **On the 8 September mark both series extend — CO2 93.32 and COA 97.20 — and nothing is claimed on either, because a mark is not a close (A9a).** \$9.26 forbids resolving the ambiguity toward whichever series would fire the upgrade, and \$9.56c required this to be disclosed BEFORE the level was straddled, which it was, on 2 September. It is NOT resolved here.

Gas produced the largest single move on the tape and it produced a record. Japan/Asia LNG closed ¥4,010, +81, the THIRTEENTH **war-record close** and the first print of this war above ¥4,000, taking out the ¥3,960 of 3 September. Against the ¥1,669 pre-war anchor that is **+140.3%** — the largest pre-war multiple anywhere on this tape and the only series here that has more than doubled. There is no 8 September print. Dutch TTF closed €73.306, +€1.354, the **SECOND**-highest close of the war; €73.634 of 2 September STANDS as the record, by **32.8 cents**, and this is **+134.8%** vs pre-war. (!) The 8 September MARK is €73.990, which is ABOVE that record close — and this is the **SECOND** consecutive edition in which the mark has been above the record. The last one settled €1.549 LOWER, so the discipline has already been tested in this exact window and paid; NOTHING is claimed on the 8 September mark either (A9a, \$9.31). (!) The record framing is restated every time it is used: '**war-record close**' means a record SINCE 28 FEBRUARY 2026 on the TZTA series and has never meant an all-time high; external reporting describes European gas as at a three-year high, and the 2022 peak is multiples above. Henry Hub has NO 7 September close (\$9.60). On its last resolved close of **\$2.975** its discount to pre-war is **2.87%**, the smallest since 8 July, which is also the last session it closed ABOVE the **\$3.063** anchor; the 8 September mark of 2.956 would put it near **3.5%**. The control still holds — American gas below where it started the war while Asian gas sets a record and European gas marks one — but it holds by single-digit cents, and this was flagged while the distance was still positive (\$9.16).

The refined-product record is again the sharpest corroboration and it is again not in crude. EIA's week to 28 August has distillate stocks at **104.2 mn bbl**, **14% BELOW** their five-year average, against refineries at **98%** utilisation, the highest since 2018, and crude runs of 17.5 mn b/d. The number that is new and worse is regional: PADD 1 distillate at **19.318 mn bbl**, down 1.685 mn on the week and the **LOWEST IN A WEEKLY SERIES THAT BEGINS IN 1990**, below the prior low of 20.966 mn set in May 2022. A system with no spare capacity cannot answer a middle-distillate shortage on the coast that consumes the most of it. (!) A second, non-Hormuz driver is named rather than absorbed: Russia's diesel export ban, in force since 8 July, was extended on 29 August to 30 September. **This document does not apportion between the two.** (!) The \$9.28 import test has still NOT reverted: EIA crude imports 6.8 mn b/d on a four-week average of 6.7, against the 6.3 that framed the test in mid-August, while commercial crude FELL **4.5 mn bbl** to 424.5. Barrels that cannot reach Asia are still being landed on the US Gulf Coast. (!) A contested 'record' is published with its series named rather than asserted: the NY Harbor ULSD-to-WTI crack reached **\$107.35/bbl** on 1 September, which one outlet called a record and another put **THIRD** on the same EIA series behind two April 2022 readings. The defensible record claim is the IEA's, on Atlantic-basin cracks and margins, and it is a different basket.

A1.4 · Strait operational — the full record, every provider, every denominator

Provider / universe	Reading	Denominator, and what it is NOT
JMIC Update 095 or later	DOES NOT EXIST at the cut. ukmt0.org JMIC index and the 2026 listings read direct on 8 September; 094 (ICOD 051500Z) is still the newest product	(!) PROSPECTIVE , not NOT OBTAINED (\$9.46). The consequence is analytical, not clerical: 094's frozen count of 101 is SILENT on 6, 7 and 8 September, so no allied product yet bears on Iran's 5 September claim beyond the day it was made
UKMTO Advisory 127-26, 6 Sep	The newest UKMTO product of any kind. Several merchant vessels 'subject to disabling fire as part of ongoing military activity'; UKMTO 'unable to confirm if any casualties or environmental impact has occurred'	(!) JMIC maps 127-26 A/B/C onto the three tankers the UNITED STATES struck, and classes them a military-on-listed-tanker event rather than an attack on a third-flag merchant, so they do NOT enter the 101. The newest item in the maritime record is the American action. The advisory text itself names no vessel; the mapping is JMIC's, not this document's inference
UKMTO 2026 warnings list	Nothing issued 7 or 8 September. The displayed sequence runs 122 (30 Aug), 123 and 124 (1 Sep), 126 (2 Sep), 127 (6 Sep)	(!) NO 125-26 APPEARS IN THE PUBLIC LIST. Recorded and NOT explained. It is not treated as a suppressed incident, because a numbering gap has many innocent causes; it is recorded because a gap in the only complete incident register in this document is a fact a reader is entitled to
CENTCOM blockade tally	94 redirected / 3 disabled / 2 boarded on 7 September, from 92/3/2 on 6 September and 87/3/2 dated 3 September	Vessels redirected by US forces since mid-July, CENTCOM's own count. (!) THE FINDING IS NOT THE SEVEN VESSELS. JMIC 094 cited 87 as 'the latest available official CENTCOM figure' on the day it published, 6 September, when CENTCOM's own count was already 92. The allied summary is a lagging record of the American operation and is not a check on it
Kpler via Reuters — commodity vessels	A ten-day moving average above 15 on Friday 4 Sep, about 13 on Saturday the 5th and 10 on Sunday the 6th — the LOWEST SINCE MAY . No 7 or 8 September reading exists	Visible commodity-carrying vessels; naval auxiliaries, offshore support, tugs and dhows excluded on size or cargo grounds; transponder-off vessels excluded. Pre-war ~130–140/day. (!) 'Lowest since May' is KPLER'S OWN characterisation and it publishes no numeric May baseline, so it is reported as the provider's superlative and converted into no percentage of anything. (!) A ten-day mean cannot fall five points in two sessions, so the three readings are not all on one basis; no rate of change is computed from them
Windward MIOC — AIS plus dark	11 transits on 5 September — 3 inbound, 8 outbound, ONE of the eleven dark. On 4 September, four dark transits including a 340m VLCC-class tanker outbound, at reduced speed, trailing a 16km surface sheen. A 228m Marshall Islands tanker made an unusual U-turn off Kumzar at 02:31Z on 7 September	ALL AIS-detected transits plus dark detections, all vessel types including small craft — three of the eight outbound on 5 September were sub-85m Iranian or Tanzanian cargo vessels. A DIFFERENT universe from every other row and never merged (\$9.24). (!) This row is what withdrew this document's own VLCC claim (A1.2a). Windward does not name the hull and classes it VLCC-CLASS, not confirmed VLCC
IMF PortWatch	7% of typical, 6 vessels on 30 August — UNCHANGED and now more than a week stale	AIS-broadcasting crossings only, against PortWatch's own 85/day pre-crisis baseline. Dark vessels are not captured at all, which on Al Jazeera's reading of the same window is more than 80% of oil and gas traffic. (!) Publishes on roughly an eight-day lag; it is carried for continuity and is NOT a reading of this window
8 September, every provider	NOT FOUND . No transit count for 8 September was published by Kpler, Lloyd's List, LSEG, Windward, Vortexa or PortWatch at the cut	(!) Stated as an absence with the providers named, rather than filled by carrying the 6 September figure forward (\$9.2)

(!) THE ORDER-OF-MAGNITUDE SPLIT INSIDE ONE DOCUMENT IS UNCHANGED AND IS RESTATED BECAUSE 094 IS STILL THE OPERATIVE PRODUCT. Its own annex gives 0, 5 and 1 non-facilitated cargo transits across 3–5 September — six in three days — against 59 US NCAGS-facilitated transits over a window 094 labels 3–5 September and calls 48 hours, while the Bab el-Mandeb line in the SAME paragraph calls the identical span 72 hours. The label and the dates disagree, so NO per-day rate is computed and NO ranking against 093's 44 or 092's 39 is asserted (\$9.19). **094 is the first issue to name the split in its own text, contrasting single-digit independent tracking with NCAGS traffic above twenty a day. Naming a discrepancy is not reconciling it.** (!) On NO denominator does traffic clear **25%** of normal, which is the maritime downgrade's second leg; the nearest reading of the war remains UKMTO VRA's 22–23% to 27 August.

A1.4a · Primary text — the statements the judgment rests on, verbatim

Speaker / document	Verbatim	Tier
Iranian MFA spokesman Esmail Baghaei, Tehran, 7 Sep	The Oman arrangement 'is now in its final stages and will include a temporary safe route through the chokepoint'	1 — Iranian government position, relayed
Mohsen Rezaei, Secretary of Iran's SNSC, state television, late 6 Sep	The restricted zone will 'begin at the US blockade line and extend into parts of the Gulf'; 'any ship entering the new zone will be added to a sanctions list'; the maps of a new corridor in Iranian and Omani waters 'have been agreed and should be signed in the coming days'	2 — two outlets, one state-TV interview. No coordinates given
Oman Ministry of Foreign Affairs, fm.gov.om, read direct 8 Sep	Site footer: 'This website was last updated on September 7, 2026.' The three items dated 7 September are a Rwandan state visit and the Arab League. Nothing on Iran, Hormuz, a corridor or a map.	1 — the central NEGATIVE , from a LIVE publisher
US State Department spokesperson, 8 Sep	'We will not allow Iran to disrupt navigation in the Strait of Hormuz and hold the global economy hostage'	2

Speaker / document	Verbatim	Tier
Qatar MFA spokesperson to CNN, 7 Sep	Opening the Strait is a priority; the world faces an 'industrial catastrophe' if the crisis continues	2. (!) One outlet renders the spokesman's first name two different ways across two days; the discrepancy is recorded
Iran parliament speaker Ghalibaf, 6–7 Sep	'The era of proportional responses is over'; American oil and gas companies across these waters 'share that exposure. Strike our assets and you get struck.'	2
Iran acting defence minister to IRIB, 8 Sep 00:45 GMT	Rejecting US claims Iran cannot reach the blockading warships: 'God willing, you will see; you will see the results.'	3 — state media only
Federal Reserve governor, 3 Sep, last speech before the blackout	'My earlier worry that higher energy prices would bleed into many goods and services prices hasn't come to pass, at least so far'; but 'it may not take much acceleration in inflation to nudge me into supporting tighter policy'	1 — full text read direct

A1.5 · Retail fuel — FOUR series, never compared, and a record reset three times

A1.5a · US retail gasoline — the two charted series, RELOCATED from the edition (\$5A)

The scored series (AUTMUSAG Index, navy) and DOE regular retail (USRFRUSA Index, amber, weekly, corroboration only); the dotted line marks the **\$4.75** upgrade trigger, NOT the **\$4.60** downgrade condition. The navy line ends on 4 September at **\$4.93**, the amber line on 31 August at **\$4.071**; neither is extrapolated through the dark 7 and 8 September cells. (!) Neither line is AAA DIESEL, which set fresh all-time highs on 4, 6 and 7 September and is not charted because no trigger is written on it — and because both charted series are GASOLINE, which has not followed diesel. (!) The legend carries the vendor's own description; the 'AAA all-grades' gloss stays **WITHDRAWN** (\$9.57).

AAA's national diesel average set a fresh all-time high on 4, 6 and 7 September: **\$5.8500**, **\$5.8970**, **\$5.9015**. AAA's own highest-recorded-price table, read direct on 8 September, carries **\$5.9015** dated 7 September 2026 — the record is now the current print. (!) Two re-verification findings follow. The superseded 2022 figure is no longer **DISPLAYED** by AAA, so its exact date is not re-verifiable from AAA today and this document stops asserting 19 June 2022, carrying only the **\$5.8159** level with its year. And the **\$5.8819** the last edition published for 5 September could not be independently re-verified on this pass; it is carried as single-source and not used for any superlative. Gasoline still does not follow: AAA regular **\$4.1505** on 7 September is **17.3%** below its own **\$5.0165** record of 14 June 2022, and on AAA's own 31 August base diesel is +30.13c on the week against regular's +6.98c, 4.3 times the pace, a third consecutive edition. Month-on-month diesel is +57.02c; year-on-year **+\$2.1927**, or **59.1%**.

(!) **FOUR RETAIL SERIES, AND THEY ARE NEVER COMPARED** (\$9.19). AUTMUSAG, the **SCORED** series, last resolved **\$4.93** on 4 September, dark on 7 and 8 September — the whole record window. USRFRUSA, the DOE weekly regular-grade spot, last resolved **\$4.071** for 31 August, its next print delayed to 9 September. AAA's headline regular, **\$4.1505** on 7 September. And EIA's own on-highway diesel survey, **\$5.599** for 31 August against an EIA all-time high of **\$5.810** for the week of 20 June 2022 — so on the EIA series the record has NOT been taken, and its next print is 9 September. Different surveys, different grades, different universes, different frequencies. The reconciliation between the scored series and AAA's published averages stays **OPEN**: the extract's own description row says only 'US Average Gasoline Price', AAA's headline is the **REGULAR** grade, and the mean of AAA's three grades is not the scored series either (\$9.57). **What is NOT impugned is the series itself: AUTMUSAG is continuous, pre-dates the war and holds a stable structural spread to the DOE series (war-long mean 65.6c on dates where both resolved). The channel is not re-based on the edition that finds its label wrong (\$9.21, \$9.57c).**

The limitation is the finding, and this edition can measure it. **The political channel is scored on a series that produced NO OBSERVATION AT ALL across the three sessions in which the fuel it is meant to proxy set three all-time records. That is not a scoring failure — the channel is at 5/5 and no documented downgrade condition was approached, so nothing would have moved on any print.** It is an instrument failure, and the honest statement is that the score was blind rather than that it was unmoved. (!) The pass-through is not confined to the pump. The ISM services prices-paid index printed 72.6 on 3 September, its highest in four years, with petroleum products, diesel and gasoline cited by name; a freight index provider reports that diesel at **\$5.599** has reset EIA-indexed fuel surcharges to their highest schedule positions of the year; and the Independent Grocers Alliance puts fuel at roughly **15% to 30%** of the total delivered cost of food, on its own denominator. (!) An economist's estimate that a sustained **\$20–30** crude move adds 0.3–0.7pp to headline CPI over six to twelve months is carried as ONE analyst's framework and is NOT this document's forecast; an untraceable bank preview of a **+0.6%** m/m August CPI is NOT USED.

A1.6 · Freight, war risk and ports

Baltic Exchange week 36, published 4 September, read direct. TD3C, 270,000 mt Middle East Gulf–China: WS 677.22 on Thursday 3 September from WS 631.67 the previous Friday, +45.55 points, giving a round-trip TCE just under **\$704,000/day** for the standard Baltic VLCC. (!) THE COMPARISON THAT CARRIES THE INFORMATION IS TD34, Gulf of Oman–China, at WS 272.5, +42 points, and a round-trip TCE just over **\$261,800/day**. That is about **37%** of TD3C's, and it is the cleanest published measure of what entering the Gulf proper costs against loading outside it. Both are named with their routes because they are not the same trade. For scale away from the Gulf: TD15 West Africa–China WS 236.88 and a TCE near **\$210,600/day**; TD22 US Gulf–China just under **\$28,000,000** lump sum; TD20 Nigeria–UKC WS 214.72; and TD6 CPC–Augusta –103 points, the Black Sea calming while the Gulf does not. Clean MEG is flat to slightly firmer: TC1 around WS 565–568, TC5 WS 621. Week 37 was NOT PUBLISHED at the cut — **PROSPECTIVE**.

WAR RISK: NO figure dated inside 4–8 September exists — **NOT FOUND**. The standing figures are carried with their bases named and their ages stated, and none is presented as current. **7.5%–10%** of hull value for Strait of Hormuz cover, 'and sometimes higher', against **1%–3%** weeks earlier — late July, Marsh via S&P Global. **3%–10%** of hull value against **0.25%** pre-war, which is **\$3mn** to **\$10mn** on a **\$100mn** tanker — mid-July, Howden Re via one outlet; (!) the last edition rendered the same range as '**\$3mn** to **\$10mn**' against a **7.5%–10%** band, which is wrong by a factor of 2.5 at the low end, and the arithmetic is **CORRECTED** here by attaching each dollar range to its own percentage band. A separate estimate of **\$1.5mn–\$4.5mn** extra per transit is a third basis and is not merged. (!) A widely-cited 40× multiple and **\$10.0mn** VLCC transit premium carries its operator's own timestamp of roughly 18 August and its own note that the multiple and the dollar figure are estimated SEPARATELY and will not divide exactly; it is stale by three weeks and is not presented as a 8 September reading. Lloyd's Joint War Committee: the Listed Areas circular is unchanged, last dated 29 July.

CONTAINERS AND LNG FREIGHT, both of which cut against the tanker story and are carried for that reason. Drewry's World Container Index was **\$4,465** per 40ft on 3 September, UNCHANGED week on week, a Transpacific rise offsetting an Asia–Europe fall, with blank sailings down from four to one as carriers return to Suez. LNG spot charter is cheap, not expensive: Spark30S Atlantic at **\$15,500/day** on 4 September, **+\$3,750** and the first weekly rise in seven weeks, against roughly **\$300,000/day** at the March shock — a round trip to about **5%** of that peak. So the LNG COMMODITY sets records while LNG TONNAGE idles, which is what a supply shock concentrated in one loading region rather than in shipping capacity looks like. (!) Carrier surcharge advisories circulating at **\$750–\$1,200/TEU** carry their operator's own timestamp of about 123 days ago and are its 'indicative editorial estimates, not contracted rates'; they are STALE and are not used for any conclusion.

A2.3 · CROSS-ASSET AND MACRO RECORD — FULL

A2.3.1 · A window with two trading days in it, and a curve that barely moved through the largest payrolls beat of the year

The effective US macro window is 4 and 8 September. **5–6 September was a weekend and 7 September a federal holiday, so this document's usual d/d comparison does not exist for any rate field and the change reported spans TWO calendar sessions.** On the 8 September marks against the 4 September closes: 2-year **+0.66 bp** to 4.3727, 5-year **+0.54** to 4.5502, 10-year **+0.41** to 4.7862, 20-year **+0.13** to 5.2482, 30-year **+0.21** to 5.2444, with the 2s10s **–0.250** to 41.144. That is a bear flattener in SHAPE — front-led, with the spread series corroborating independently — and it is very small. (!) **It is NOT monotonic with tenor: the 30-year rose more than the 20-year, and that is stated rather than smoothed, because a 'falling monotonically with tenor' claim was the largest joint finding of the last edition's two reviewers.** (!) The size is the observation. The largest move anywhere on the curve is two-thirds of a basis point across two calendar days, following a payrolls print that ran about five times its own twelve-month trailing average. Every **war-high close** set on 1 September survives on the marks: the 2-year by **2.71 bp**, the 5-year by **0.49 bp** — the nearest any tenor stands to its own — and the 10-year by 1.19; the 30-year's 5.3060 of 17 August stands by **6.16 bp**.

THE VOLATILITY LEG IS **UNRESOLVED**, NOT **SATISFIED** A **THIRD** TIME, AND THE DISTINCTION IS THE WHOLE OF \$9.9. MOVE has no print for 7 or 8 September. **Its last close is 73.10 on 4 September — a second consecutive close below 75 and the first below the 73.38 pre-war anchor since 28 August. On that close the Treasury downgrade's volatility leg IS satisfied, for a second session.** Two sessions of silence do not make a third close. \$9.9 was written after MOVE went dark through a **10.9 bp** long-end move in July and the stale low read as calm; the same trap is live now, in a week carrying **\$119bn** of coupon supply and a CPI print. (!) \$9.18 is not discharged by two closes in any case: the longest sub-75 run of the CURRENT regime is NINE closes, 18–28 August, ended in one session on 31 August at 75.32, and the leg was satisfied and given back inside a single session on both 5 and 7 August. The war's longest run is TWENTY-ONE closes, 10 June–10 July, in a regime that no longer obtains (\$9.32). The yield leg fails by **24.23 bp** on the same close and has not closed below **5.00%** since 6 July. (!) A BOUNDING ERROR FROM THE LAST EDITION IS **CORRECTED** HERE: 'the yield leg has never in this war come within **15 bp** of its condition' is unbounded and misleading, because the **4.6106%** pre-war anchor sits **39 bp** INSIDE the condition — the leg was satisfied for the whole period before the war. The claim is true only of the CURRENT regime and is written that way from now on. (!) THE ANOMALY IS **UNRESOLVED** RATHER THAN PRESENT, and that is a different statement. On the last resolved closes, Treasury volatility sits 0.28 points **BELOW** its 73.38 anchor while the 30-year sits **63.17 bp** **ABOVE** its 4.6106 anchor — a fully normalised expectation of movement around a yield that has not normalised at all. Both halves of that comparison are now stale: one leg has not printed for two sessions and the other has no 7 September close. It is restated as of 4 September, no live reading is claimed, and the two deviations are reported SEPARATELY with no composite constructed. Threshold C is **NOT ARMED** and is **UNRESOLVED** since 4 September: on 73.10 it is 56.90 points below 130 and 41.92 below the 115.02 **war high** of 26 March.

A2.3.2 · The August employment report, the consensus that is not a number, and the data around it

The report stands as published on 4 September, read direct from the BLS release. Nonfarm payrolls +162,000; unemployment **4.1%**, unchanged; average hourly earnings **+\$0.10** or **+0.3%** to **\$37.75**, **+3.1%** y/y; the workweek +0.1 hour to 34.4. June was revised UP to +31,000 and July UP from –23,000 to +21,000 — a net two-month revision of +55,000, and July flips from a contraction to an expansion. Participation **61.6%**, employment-population **59.1%**, long-term unemployed 1.9mn or **27.0%** of the total. By industry: food services and drinking places +59,000 against a +12,000 twelve-month average; local government education +42,000; construction +22,000; manufacturing +16,000; health care only +13,000 against a +32,000 twelve-month average; information –23,000. (!) THE CONSENSUS IS NOT A SINGLE NUMBER AND THIS DOCUMENT WILL NOT PRETEND OTHERWISE (\$9.19). Three relays give 53,000, 56,000 and 65,000, and one bank's own estimate was 40,000 against a consensus it put at 55,000. A RANGE is reported and no multiple is computed off a point estimate.

The figure that does the work is the prior twelve-month average of about +31,000 a month, which is the denominator that makes the print large. (!) One relay put the unemployment rate at **4.0%**; the BLS release governs at **4.1%**. The data around it, none of which falls inside 4–8 September and all of which is dated. ISM Services, released 3 September: headline 55.4, +1.3 and the fastest in six months; business activity 61.7; new orders 60.9; PRICES PAID 72.6, up from 70.3 and a FOUR-YEAR HIGH, with petroleum products, diesel and gasoline cited by name as up in price; employment contracting for the fifth time in six months at 47.8. (!) The two halves point DIFFERENT WAYS and are not merged: services employment is already contracting while the aggregate payrolls print ran hot. Initial claims, released 3 September for the week to 29 August: 206,000, +2,000, four-week average 207,250, continuing claims 1,779,000; no claims release falls inside this window and the next is 10 September. NO Beige Book and NO NFIB August print fall inside the window — **PROSPECTIVE** or outside it, not **NOT FOUND** (\$9.46).

A2.3.3 · Fed pricing — a confirmed silence, a withdrawn pair, and the two sentences that are the September debate

NO Federal Reserve speech occurred between 4 and 8 September. That is a CONFIRMED ABSENCE, not a retrieval failure: the Board's own September calendar lists two speeches for the whole month, both before this window, and the FOMC communications blackout opened on Saturday 5 September ahead of the 15–16 September meeting. The last word before it was a governor's, on 3 September, and it cuts AGAINST the pass-through thesis this document has been building. On the record: his earlier worry that higher energy prices would bleed into many goods and services prices 'hasn't come to pass, at least so far', while energy prices 'have moved up again and remain significantly higher' than at the start of 2026. And the reaction function, explicitly: he is willing to hold if there is continued progress toward **2%**, but 'if inflation comes in hot, I would consider a rate hike', and 'it may not take much acceleration in inflation to nudge me into supporting tighter policy' — his vote 'heavily influenced by what we learn about August inflation'. His cited figures: July PCE +**0.2%** m/m headline and core; twelve-month PCE **3.7%**, core **3.3%**; three-month core **3.05%** through July from **4.76%** in February; H1 real GDP +**1.8%** annualised. Those two sentences are the whole September debate, and they are HIKE-versus-HOLD, not hold-versus-cut.

(!) A WITHDRAWAL. The last edition published CME-implied September HIKE odds as **66.1%** (31 Aug), **48.4%** (3 Sep) and **58.4%** (4 Sep), described as one venue's series held throughout. On re-verification NO source reached carries those decimals, and direct CME FedWatch could not be reached. The decimals are **WITHDRAWN** (\$9.13). What IS sourceable, each with its outlet and timestamp and never spliced into one series (\$9.24): about **50%** on 28 August, **66%** and **70%** on 31 August from two different outlets, about **52%** on 4 September after payrolls, and **59%** on 5 September at 15:10. The DIRECTION — up into the high fifties on the payrolls beat — is corroborated across outlets and survives; the LEVELS are single-outlet and are reported as such. (!) A CUT is not priced at all in any source reached: the entire distribution is hike-versus-hold. Prediction markets on the same timestamp: one venue **50%** for a September hike; another **73%** for a hike before 2027, which is a DIFFERENT CONTRACT and is never compared with the September number. (!) On the strait itself, the same operator's markets price near-term reopening at almost nothing: traffic returning to normal by 31 December at **25%** on **\$10.5mn** of volume, by 30 September at **2%**, by 15 September at under **1%**.

The FOMC meets 15–16 September, statement 14:00 ET and press conference 14:30 on the 16th; the current target range is 3.50–**3.75%** and the July meeting held 9–3 with two members voting to hike. August PPI lands 10 SEPTEMBER and August CPI 11 SEPTEMBER — note the ORDER, PPI before CPI this month — and both fall INSIDE the blackout, four and five days before the decision. (!) One relay put CPI on 13 September; the BLS schedule governs at 11 September. The July CPI actuals for reference: +**0.1%** m/m, **3.4%** y/y headline, core **2.5%**, with the gasoline index **-2.9%** m/m but energy +**14.7%** and fuel oil +**39.1%** y/y.

A2.3.4 · Treasury supply — \$119bn of coupons, \$246bn of bills, and a buyback correction

All six securities were announced on Thursday 3 September, pulled forward, and the four securities auctioning on 8 September carry a special holiday-rescheduling notice. Tuesday 8 September, with the 13- and 26-week bills auctioning on a TUESDAY rather than their customary Monday: a **\$92bn** 13-week reopening, a **\$79bn** 26-week new issue, a **\$75bn** 6-week reopening — **\$246bn** of bills — and a **\$58bn** 3-year note, CUSIP 91282CRL7, issuing 15 September. Wednesday 9 September: a **\$39bn** 9-year-11-month reopening of the **4.625%** of August 2036, CUSIP 91282CRF0. Thursday 10 September: a **\$22bn** 29-year-11-month reopening of the **5.125%**, CUSIP 912810UW6. **\$119bn** of coupons, ALL settling 15 September, the first day of the FOMC. (!) Results for NONE of them exist at the cut: the 8 September auctions are same-day and the rest have not occurred. **PROSPECTIVE** (\$9.46). (!) NO trend is read from **\$22bn** against August's **\$25bn**: a reopening is not a new issue and the denominators differ (\$9.40). Threshold A remains **UNTESTABLE AS WRITTEN** — it needs a when-issued level Treasury does not publish — so read the allotment composition from the Fiscal Data auctions API, never an unsourceable tail (\$9.29, \$9.39).

(!) THE BUYBACK CLAIM IS **CORRECTED**. The last edition said, twice, that the enlarged long-end buyback regime BEGINS on 9 September, the same session as the 10-year reopening. **That is not what Treasury's own schedule says**. The tentative schedule published 5 August has 9 September as a CASH MANAGEMENT operation in nominal coupons 1Mo–2Y, maturity range 10/10/2026–09/09/2028, for up to **\$12.5bn** — a short-end operation — and 10 September as the LIQUIDITY SUPPORT operation in nominal coupons 10Y–20Y, shown at **\$2bn** on a table that predates the increase by two weeks. The press release of 19 August raising the maximum from **\$2bn** to at least **\$4bn** per operation for the 10Y–20Y and 20Y–30Y sectors says the change is 'effective September 9, 2026 and will be in effect for the remainder of this refunding quarter, through November 4, 2026'. Both readings are published and neither is resolved here: 'effective September 9' is consistent with the schedule only if it refers to the ANNOUNCEMENT date of the 10 September operation, which is announced on the 9th. (!) The updated tentative schedule promised in that release has STILL NOT BEEN PUBLISHED — **NOT FOUND**, three weeks on. The next Quarterly Refunding is 4 November, the same date the enlarged regime terminates, by design.

A2.3.5 · War powers, and a cost figure with two irreconcilable answers

NO war-powers vote, no new resolution and no legal challenge occurred between 4 and 8 September — a checked absence, one senator's press-release index read direct with nothing on Iran in the window. The standing position is unchanged: the clock opened by the 10 July notification has run out, a privileged resolution awaits a motion, and the last vote was the 30 July defeat of a resolution, 49–50. Congress returned to session the week of 7 September. The **\$87.6bn** supplemental, the House's **\$95bn** package and the department's separate request of at least **\$200bn** all remain unresolved. (!) A COST FIGURE APPEARED IN THE WINDOW WITH NO WAY TO RECONCILE IT. A senator said on 8 September that the war 'cost Americans **\$100bn**' and rises 'by another **\$1m**' every two minutes. A wire service's standing figure is more than **\$37.5 billion**. Both are on the record, the gap is a factor of 2.7, no reconciliation was found, and they are NOT averaged (\$9.19).

A2.3.6 · The SPR, and the physical balance

The SPR is unchanged at **286.6 mn bbl**, EIA, data-dated the week ending 28 August and released 2 September — **–3.1 mn** on the week, roughly **40%** of the 714mn-barrel authorised capacity and 445mn barrels below it. (!) Two sourcing cautions carried forward. Secondary vendors restate this as ‘as of 2 September’, which is the PUBLICATION date presented as the DATA date; no newer print exists and the next WPSR is 10 September. **And two secondary sources give different November 1982 dates for the ‘lowest since’ comparison, while EIA’s own weekly carries no ‘lowest since’ label at all, so the month is used and the day is not.** NO new SPR action was taken 1–8 September — **NOT FOUND**. DOE continues executing the 11 March authorisation of 172mn barrels over about 120 days as the US share of a 400mn-barrel IEA collective action, structured as exchanges with 18–22% minimum return premiums and returns due November 2026 to September 2028.

OPEC+ held October output UNCHANGED at a virtual meeting on Sunday 6 September, the eight-country group ending its run of monthly increases. The stated reason is the one worth carrying: the group must first review members’ production capacity to set 2027 output baselines, which form the basis of quotas — a review that ‘could also change the balance between countries with substantial spare capacity and those already producing close to their technical limits’. That is a process, not a barrel, and it is the ONLY spare-capacity commentary found in the window. (!) NO quantified OPEC+ spare-capacity figure dated 4–8 September exists — **PROSPECTIVE**, not **NOT FOUND**. The next meeting of the eight is 4 October. **A preview figure of 188,000 b/d under discussion was NOT adopted and is not carried as a decision.** The September STEO is due 9 September and the WPSR 10 September, both **PROSPECTIVE** at the cut. The August STEO stands: Brent averaging **\$85/bbl** in Q3 2026 on an assumption that severe Hormuz constraints persist.

The gas balance, which is where the physical shock is most legible. QatarEnergy’s force majeure was extended again in late August, pushing cancellations to European buyers into November; the root cause is the 18–19 March strike on Ras Laffan, which removed roughly **17%** of Qatar’s LNG export capacity, about 12.8 mtpa. Cumulative Hormuz LNG loss is put at over 50 bcm March–August, offset by non-Gulf production up about 35 bcm year on year, absorbing around two-thirds — leaving net global LNG supply about **6%** lower, just over 15 bcm, since 1 March. US LNG exports averaged 17.4 Bcf/d in H1 2026, **+23%** y/y. (!) EUROPEAN STORAGE HAS THREE INCOMPATIBLE READINGS IN THIS WINDOW AND NO **TIER 1 ACCESS WAS OBTAINED: 66.59%** on 5 September on one calculation from GIE data, **65.4%** on 30 August on another, and ‘around **62%**’ repeated verbatim in copy from two different days and possibly stale. The true 5 September figure is treated as **65–67%** and **UNRESOLVED**; what is not in dispute is that it is below the five-year range for the date, against a regulatory target relaxed toward **80%** for this winter. (!) Refined-product capacity: global refinery runs are put about 7.5 mn b/d below July 2025, and Gulf jet exports through Hormuz plus Bab al-Mandeb at 68,000 b/d in August, **–88%** from February’s 574,000 b/d — the denominator named because the percentage is meaningless without it.

A2.3.7 · Corporate and industrial pass-through — and the absences that are findings

NO new US refinery outage, run cut or force majeure was announced 1–8 September — **NOT FOUND** across the major independents, on a search whose method is named. (!) **A DATE TRAP is recorded because it circulates: a widely-shared US Gulf refinery explosion story is dated 24 March 2026, not September, and is not carried.** Outside the US and inside the window, Saudi Aramco’s Jizan refinery, 400,000 b/d, was struck again on 7 September, a second strike in about a month, with damage still being assessed — **TIER 2**, single outlet, and attributed to NO GROUP. Jizan is the Red Sea hub Saudi Arabia has been using to route barrels AWAY from Hormuz, and it had already been shut since 27 July. **It is NOT attributed to Iran and does not move the regional-relapse line.** NO US airline made any 8-K, guidance revision, capacity revision or hedging disclosure in the window — a full-text filing search returning zero, validated against a control window. USGC jet fuel was **\$4.190/gal** on 1 September, **+10.1%** from 28 August. (!) One European carrier cut FY27 traffic guidance on 2 September to reduce unhedged winter oil exposure, and one Asian carrier’s fuel surcharges FELL from 1 September on a lagged two-month assessment plus a government subsidy — direction of travel OPPOSITE to spot, and evidence of a lag mechanism rather than of the shock easing. (!) THREE US emergency electricity orders were issued inside the window and NONE of them is an oil-shock event. Their own texts attribute them to heat and demand reliability, not to fuel security or Hormuz, and they are recorded here precisely so that they are not mischaracterised elsewhere. Two utility fuel-adjustment actions in the window point in OPPOSITE directions from spot, both for lagged-mechanism reasons: one Alaskan cooperative CUT its quarterly fuel and purchased-power charge **12.6%** effective 1 September, citing fuel prices having stabilised since June; one Pacific territory announced an increase whose exact figure is published only as page images and is **NOT FOUND**. The policy response that IS live inside the window is the EPA emergency Clean Air Act waiver announced 20 August and effective from 1 September, allowing higher-vapour-pressure E10 and effectively ending the summer-blend requirement early, through the end of the control season on 15 September. A White House meeting with refiners and distributors on 1 September produced no reported concrete output — **NOT FOUND**. No export restriction, no federal or state gasoline-tax holiday and no new price-gouging action was enacted 1–8 September.

A7 · SOURCE LOG

Tier 1 = primary or official. Tier 2 = reputable wire or press. Tier 3 = state media or relayed claim, corroborated against Tier 1 before it is used for anything market-moving. **NOT OBTAINED** = sought and missed, with the method named. **PROSPECTIVE** = relates to a session or publication that had not occurred at the Singapore cut, and is not a retrieval failure (\$9.46). Every ‘used for’ below was checked against what is actually published in the two documents; an entry that supports nothing published has been deleted.

Tier	Source	Used for
1 · DATA	Tecity Bloomberg extract, ‘US Iran BBG Data.xlsx’, pulled 8 Sep. 181 rows × 99 columns; tickers read from the header scan, never hardcoded (\$3)	EVERY price, yield, spread, volatility and retail-fuel figure in both documents. The scoring reference SPLITS: the 7 September close for energy, the 4 September close for every rate field, no 7 September rate close existing (\$9.58). The 8 September row is intraday and moves nothing. (!) No price is taken from the web. The extract’s own row-1 description for AUTMUSAG — ‘US Average Gasoline Price’ — keeps the ‘AAA all-grades’ gloss withdrawn (A1.5)

Tier	Source	Used for
1	US Central Command public release, 5 Sep, 'CENTCOM Destroys 3 IRGC Oil Tankers After Iran Targets 2 U.S. Navy Warships', plus the released strike video, read direct from centcom.mil	THE SINGLE MOST IMPORTANT TIER-1 ITEM THIS EDITION. The Iranian ballistic-missile launch at a carrier and a guided-missile destroyer and the statement that both evaded with no US personnel harmed; the three NAMED tankers and their damage assessments; and Adm. Cooper's on-record statement — which describes three Iranian tankers taken for two US ships fired on, a three-for-two and not a one-for-one — and which DISCHARGES the 'tanker for tanker' DOCTRINE from TIER 2 to TIER 1 while correcting its arithmetic. The Secretary of Defense said the same in public the same day, on his own social-media account, carried by Iran International and Al Jazeera. (!) It is the FIRST CENTCOM product of this war carrying both a target list and a BDA
1	ukmto.org JMIC index and both 2026 UKMTO listings enumerated at href, read direct 8 Sep; JMIC Update 094 primary PDF (ICOD 051500 UTC); UKMTO Advisory 127-26 of 6 Sep	THE CENTRAL PROSPECTIVE GAP: no JMIC Update 095 or later exists at the cut, so 094 remains operative and its frozen count of 101 is SILENT on 6, 7 and 8 September. Also: 59 NCAGS-facilitated transits for a window 094 labels 3–5 Sep and calls 48 hours while calling the identical span 72 hours one line later, and the 0/5/1 annex figures; Hormuz SEVERE ; and the ABSENCE, on a verbatim comparison of 092, 093 and 094, of any mine danger area, coordinates or NAVCENT clearance sentence for a SECOND consecutive issue. (!) UKMTO issued NOTHING on 7 or 8 September, and no 125-26 appears in its public 2026 list — recorded, not explained
1/2	Mohsen Rezaei, Secretary of Iran's SNSC, Iranian state television late 6 Sep, carried by two outlets; Iranian MFA spokesman Esmail Baghaei, Tehran, 7 Sep, relayed	The announced EXCLUSION ZONE, its stated geometry from the American blockade line into the Gulf, and the sanctions-list consequence; the claim that Hormuz maps are agreed with Oman and will be signed within days; and the MFA's separate statement that the deal is 'in its final stages' and will include a temporary safe route. (!) Used as statements of IRANIAN intent. The OMAN half is a claim about a third party and is reported against Oman's own silence, not with it. A second voice from the same government is NOT a second source (\$9.24). No coordinates were given, and the circulating map is not an official Iranian chart
1	fm.gov.om homepage, Statements archive and site search for 'Hormuz', all read direct 8 Sep	THE CENTRAL NEGATIVE, with its three queries stated (\$9.23c): no Omani statement confirming agreed maps or an imminent signature, and no Iran, Hormuz, mediation, corridor or map publication dated 5–8 September. Crucially the site is LIVE, not stale: its own footer reads 'last updated on September 7, 2026', and all three items it carries for that date concern a Rwandan state visit and the Arab League. The last substantive Iran item is the 25 August joint statement; a 6 September UK working-group readout mentions Omani diplomatic efforts on Hormuz in general terms only. A silence from a live publisher is evidence; a silence from a dead page is not
1	centcom.mil Public Releases index, read direct 8 Sep; ofac.treasury.gov Recent Actions index, read direct 8 Sep; US State Department remarks, 8 Sep	THE OTHER NEGATIVES, each with its query: NO CENTCOM release of any kind dated 6, 7 or 8 September, the index topping out at 5 September; NO OFAC or FinCEN action on 5–8 September, the index running 4 Sep (Iran), 3 Sep (Cuba/Russia), 2 Sep (Venezuela). And the POSITIVE inside the window: the State Department on 8 September that it 'will not allow Iran to disrupt navigation in the Strait of Hormuz and hold the global economy hostage', alongside the administration's position that it would not recognise an Iran–Oman agreement
1	BLS Employment Situation for August, released 4 Sep, read direct from the news-release archive; ISM Services PMI for August, 3 Sep; BEA/Census US International Trade for July, 3 Sep; Census M3 factory orders, 2 Sep; US Treasury daily par yield curve, downloaded 8 Sep; Federal Reserve Board September speech calendar and the 3 Sep speech text, read direct	Payrolls +162,000, unemployment 4.1% , AHE + 0.3% m/m and + 3.1% y/y, and the +11,000 / +44,000 revisions; ISM Services 55.4 with Prices Paid 72.6 and Employment 47.8; the July deficit at \$88.6bn and its 29.6% year-to-date narrowing; factory orders + 0.9% . (!) The Treasury CMT series is used for TWO things and no others: to corroborate the SHAPE of the 4 September move, and to corroborate that the 10-year breakeven was FLAT at 2.35% across 1–4 September — two decimals, direction only, never substituted for the extract's four-decimal generics and never used to resolve an unresolved cell. Also the CONFIRMED ABSENCE of any Fed speech 4–8 September, the blackout having opened 5 September
1	fiscaldata.treasury.gov auctions API and the tentative auction schedule (the standing method under \$9.39a), queried direct 8 Sep; Treasury press release SB0607 of 19 Aug; the Tentative Schedule of Treasury Buyback Operations published 5 Aug	The \$58bn 3-year (8 Sep), \$39bn 10-year reopening (9 Sep) and \$22bn 30-year reopening (10 Sep), all settling 15 Sep; the \$246bn of bills auctioning 8 September off the usual Monday; the 20-year and 10-year TIPS reopenings that follow; and the buyback schedule. (!) THE LAST EDITION'S CLAIM THAT THE ENLARGED LONG-END BUYBACK BEGINS 9 SEPTEMBER IS CORRECTED : the tentative schedule has 9 September as a CASH-MANAGEMENT operation in 1Mo–2Y coupons up to \$12.5bn , and the 10Y–20Y liquidity-support operation on 10 SEPTEMBER, while SB0607 says the increase is 'effective September 9'. Both readings published; neither resolved. (!) TreasuryDirect announcement pages return empty to a fetcher — the API is the only route that works
1	AAA Daily Fuel Gauge and its highest-recorded-average-price table, read direct 8 Sep, page stamped 'price as of 9/7/26'; EIA Weekly Petroleum Status Report highlights and the EIA Gasoline and Diesel Fuel Update holiday release schedule, read direct	Regular \$4.1505 , mid \$4.6325 , premium \$5.0255 , diesel \$5.9015 and every week/month/year comparator; AAA's own record table now reading diesel \$5.9015 dated 7 September 2026. (!) The superseded 2022 figure is NO LONGER DISPLAYED, so its 19 June date is not re-verifiable from AAA and is no longer asserted; and the \$5.8819 published for 5 September could not be re-verified. From EIA: SPR 286.6 mn bbl for the week to 28 August, crude imports 6.8 mb/d , distillate 104.2 mn bbl and 14% below the five-year average, PADD 1 distillate 19.318 mn bbl , the lowest in a series beginning 1990, utilisation 98% ; EIA on-highway diesel \$5.599 for 31 August against an EIA all-time high of \$5.810 . (!) CORRECTED : the retail print is delayed to 9 SEPTEMBER and the WPSR to 10 September — two delays of different lengths, merged in error last edition
1/2	Baltic Exchange weekly report for 4 September, republished by DCN	TD3C at WS 677.22 on 3 September, +45.55 on the week, TCE just under \$704,000/day ; TD34 Gulf of Oman–China at WS 272.5 and a TCE just over \$261,800/day , about 37% of TD3C's; TD15, TD22 and TD6; TC1, TC5 and TC17. (!) Week 37 was NOT PUBLISHED at the cut

Tier	Source	Used for
1/2	Kpler via Reuters, 7 Sep; Windward MIOC daily intelligence, data-dated 4–5 Sep and read direct; IMF PortWatch; Drewry World Container Index and Spark Commodities via LNG Prime	The ten-day moving average collapsing from above 15 on 4 September to about 13 on the 5th and 10 on the 6th, the LOWEST SINCE MAY; Windward's 11 transits on 5 September and its four dark transits on the 4th including the 340m VLCC-class outbound trailing a 16km sheen; the container index unchanged at \$4,465/40ft ; Spark30S at \$15,500/day . (!) THE WINDWARD ROW IS WHAT WITHDREW THIS DOCUMENT'S OWN VLCC CLAIM (A1.2a). (!) PortWatch has not published past 30 August and is labelled a week stale rather than refreshed. (!) NO provider published an 8 September count
2	Reuters, Al Jazeera, Al-Monitor, The National, CNN, FT via wires, 4–8 Sep	OPEC+ holding October output unchanged on 6 September and its stated 2027-baseline-review reason; CENTCOM's blockade tally at 92/3/2 (6 Sep) and 94/3/2 (7 Sep); the Qatari and Emirati statements; the parliament speaker's remarks; the 7 September strike on Saudi Aramco's Jizan refinery, attributed to NO group. (!) The 4 September reported attack on US targets in JORDAN remains UNCONFIRMED into a second day, addressed by no government, and is never merged with the confirmed 31 August or 1 September Jordan events. (!) A senator's \$100bn war-cost figure and a wire service's \$37.5bn are BOTH recorded and NOT averaged
3	IRIB, IRNA, Iranian state television, 5–8 Sep	The acting defence minister's 8 September 'you will see the results', carried as a STATEMENT and not an event (\$9.11). The IRGC's 5 September claim to have struck three tankers stays UNCORROBORATED into a fourth day: no vessel named, no flag, no damage report, no JMIC incident and no UKMTO product. RECORDED AND NOT USED for any finding: the claim that the US warships sustained damage, which CENTCOM contradicts and for which no imagery or third-party confirmation exists
NOT OBTAINED	Any Hormuz transit count for 8 SEPTEMBER from ANY provider; any LSEG or Vortexa count for this window; any Kpler reading for 7 or 8 September; any Kharg queue or Iranian loading figure dated 4–8 September; UKMTO VRA Overview No. 5; official ICE Endex TTF settlements and Platts JKM assessments for the whole window (both paywalled); a TIER 1 GIE/AGSI European storage read; CME FedWatch direct from cmegroup.com, and specifically the 48.4% and 58.4% pair this document published last edition; the updated tentative buyback schedule promised in SB0607 on 19 August	Recorded as gaps with the method named, so the reader can distinguish a fact about the world from a fact about the fetch (\$9.50). (!) THE FEDWATCH GAP HAS NOW COST A PUBLISHED FIGURE: unable to reach the venue for a FOURTH consecutive edition, this document published a decimal pair it cannot now re-verify, and has WITHDRAWN it. The hike-odds series is carried entirely from dated secondary relays, each with its outlet and timestamp, never spliced. (!) European storage has THREE incompatible secondary readings spanning about 4.5 points and is reported UNRESOLVED rather than picked between
SUPERSEDED / RESOLVED	WITHDRAWN : 'no VLCC has exited the strait since 2 September' (A1.2a), and the 48.4% → 58.4% hike-odds pair. CORRECTED : the enlarged long-end buyback beginning 9 September; the delayed EIA retail print being 10 rather than 9 September; the war-risk arithmetic pairing \$3mn–\$10mn with a 7.5%–10% band; and the unbounded 'the yield leg has never come within 15 bp '. NO LONGER ASSERTED: 19 June 2022 as the date of AAA's superseded diesel record. SUPERSEDED : the blockade tally at 87/3/2, by CENTCOM's own 92 then 94	Two withdrawals, four corrections and one de-assertion — and ALL SEVEN come from RE-VERIFICATION rather than from news, which is \$9.13 doing the work it exists to do. The distinction is kept: a WITHDRAWAL means the claim was wrong as published; a CORRECTION means a figure or date was wrong; a SUPERSESSION means it was true at its own cut and has been overtaken (\$9.46)
PROSPECTIVE	JMIC Update 095, on which the whole maritime record now waits; the 3-year auction (8 Sep, same-day), the 10-year reopening and the short-end cash-management buyback (9 Sep), the 30-year reopening and the 10Y–20Y buyback (10 Sep); the EIA retail print and September STEO (9 Sep); the WPSR (10 Sep); August PPI (10 Sep) and CPI (11 Sep); the FOMC (15–16 Sep); Baltic week 37; the September IEA and OPEC monthlies; the E3-and-US IAEA draft resolution, still NOT SUBMITTED	Not retrieval failures. (!) ONE item has crossed OUT of this register into NOT OBTAINED for a sixth edition: the updated tentative buyback schedule promised in SB0607 on 19 August, for a regime whose first affected operation is tomorrow, is a failure to publish rather than a prospective item. (!) JMIC 095 is the one that matters: until it issues, no allied product bears on anything after 5 September, and the frozen count of 101 must not be read as a finding about 6–8 September

A8 · ON-DEMAND UPDATE PROTOCOL

#	Step	Detail
1	Refresh and verify the extract	Never build an edition off a stale extract (\$9.22). Check the file mtime AND parse the sheet. This edition: the extract carries an 8 September row against the 7 September row the last edition ran on. It is fresh, but the refresh is PARTIAL — some 7 September cells settled, some carried and three LOST the values they held (\$9.60).
2	Parse with a dynamic header scan	Column indices move between uploads. Auto-detect the Brent and WTI front month and take whatever label the header scan returns for DXY. Re-verify the 27 February anchor field by field — done this edition, unchanged on all seventeen fields listed at A10.1, and on SOFR at 3.68. (!) Read the DESCRIPTION row, not just the ticker row: doing so is what exposed that AUTMUSAG is labelled 'US Average Gasoline Price' and not 'AAA all-grades' (A1.5, \$9.57). A ticker map is not a definition.
3	Run all THREE integrity checks	Row-level (\$9.8), field-level identical-value at the precision each series is published to (\$9.35, \$9.48), and the continuation-versus-active BASIS check (\$9.41). This edition: \$9.41 CLEARs ; \$9.35 FIRES ON BOTH ROWS — on seven fields of the 7 September row with a known and benign cause (Labor Day), and on BE10 alone in the LIVE 8 September row, which is the pure case. \$9.8 FIRES in a form not previously recorded: three cells published as 7 September marks last edition are BLANK in this extract. The row LOST data it had. NEW PITFALL \$9.60.
4	Run the backfill check in BOTH directions	\$9.10: yesterday's dark cells must be re-examined, not carried, and a backfill is as likely to run against a trend as with it. This edition it fired on TWO cells, both for 3 September and both UPWARD: AUTMUSAG to \$4.92 , two cents above the value carried and the highest since 29 May though NOT a war high , WIDENING the political distance to 32 cents ; and SOFR to 3.66, resolving the non-backfill the last edition recorded. The test has now fired UPWARD on the scored gasoline series in FIVE consecutive editions — \$4.83, \$4.86, \$4.90, \$4.92 — against a downgrade case that was live a fortnight ago.

#	Step	Detail
5	Compute deltas and test every trigger	d/d, w/w five rows back, and versus pre-war; explicit trigger tests for the four market channels plus Stage-4 A, B and C. Run min, max and last-prior-occurrence on the full column before writing ANY superlative (\$9.32). This edition that discipline established that \$2.68 is the nearest reading since 21 August and NOT of the war; that Threshold B's six-close run IS the longest of the regime; that Henry Hub's discount is the smallest since 8 July; and — the correction — that the count of active-contract closes above \$95 published last edition was one too high.
6	Verify the news, and re-verify what was inherited	Every claim needs a named source and an exact date, and negative claims decay fastest of all (\$9.23). State the exact query behind every negative. Say NOT OBTAINED rather than estimating, and distinguish it from PROSPECTIVE (\$9.46). (!) This edition the discipline paid in the other direction: the last edition's 'no sanctions landed' and 'tanker for tanker is one anonymous chain' were both true at their cut and both were overtaken within hours, so they are SUPERSEDED rather than withdrawn. A negative that expires is not a negative that was wrong, and the two are recorded differently.
7	Build, then QA in three passes	A numeric harness against the dataframe; a STYLE harness measuring bold ratio and headline length (\$9.52, \$9.55); an adversarial PROSE pass by reviewers with no access to the source data, run as TWO reviewers CONCURRENTLY against the same pre-fix text and merged into one patch (\$9.42); and a VISUAL render, which is not optional (\$9.43). Re-run the numeric and style harnesses AFTER the prose fixes. Balance the bold tags in every fragment after every edit (\$9.42a). Check the page budget at build time, not after the prose is final (\$5A).
8	Deliver both documents	The edition and the annex go into the project root together. A file that is not committed never reaches the reader. The annex does not go into the dashboard PDF folder, because the score-history script regexes a score sentence out of every PDF there and the annex has none. Then snapshot the fragments under a date-stamped name, at the END of the run, so no edition can overwrite another's sources.

A9 · METHODOLOGY

Six channels, each scored 0–5, summed to 0–30. Bands: 0–7 watch; 8–14 stress; 15–21 systemic-risk watch; 22–30 crisis. Maritime denial and escalation risk are event channels; oil, US inflation impulse, Treasury stress and political stress are market channels scored on confirmed closes.

(a) Confirmed closes only for market channels. No market channel moves on an intraday print. The 8 September snapshot moves nothing — including an active-contract mark of **\$97.20** that is through the trigger level, and a TTF mark of €73.990 that is ABOVE the war-record CLOSE and is not reported as a record. (!) THAT DISCIPLINE WAS TESTED IN THIS EXACT WINDOW AND PAID: the last edition's TTF mark of €74.855 was also above the record, nothing was claimed on it, and it settled €1.549 LOWER and BELOW the record. (b) Hysteresis, and it is now being tested from the other side. Upgrades fire on a sustained break; downgrades require a sustained reversal past a wider threshold. The 5y5y forward closed BELOW its own firing level on 28 and 31 August and two editions came under pressure to redefine the downgrade to meet it; the rule was NOT moved, and the forward has closed ABOVE the level on 1, 2, 3 and 4 September. (!) THE COUNT STAYS AT FOUR THIS EDITION: 7 September produced no close, so no fifth is claimed. The fourth cleared by **0.82 bp**, the tightest of the four, and a margin inside one session's typical move is not clearance. **The rule is not rewritten now that it is thin, for the same reason it was not rewritten when it was broken (\$9.16, \$9.26).** (c) The scale saturates in BOTH directions (\$9.7, \$9.27). FIVE of six channels are at the cap, so the score could not register US retail diesel setting three fresh all-time highs in four days, Hormuz traffic at its lowest visible reading since May, a blockade tally moving three times in four days, or a second consecutive edition in which Iran announces a bilateral Hormuz instrument with no counterparty text. Nor could it register what cut the other way — no acknowledged American strike on Iranian soil for a seventh day, no Iranian attack on any Gulf state since 3 September, and ten-year inflation compensation that did not move at all. A flat 27 is an instrument at its stop.

Rules exercised this edition, named so the reader can audit them. \$9.41 **CLEARs**; \$9.35 FIRES on BOTH rows; \$9.8 FIRES in a new form and produces \$9.60 (A1.1). \$9.9 — ENGAGED and load-bearing: MOVE is dark for two sessions and the volatility leg is reported **UNRESOLVED**, not satisfied a third time, because a stale low is not reassurance. \$9.10 — the two-way backfill test fired on ONE cell, upward again, and has now fired upward on the scored gasoline series in FIVE consecutive editions. **\$9.11 — an announcement is not an event, and it did the most work of any rule this edition: three Iranian principals escalated verbally on 6, 7 and 8 September and NONE of them moved the escalation channel, in either direction.** \$9.13 — a prior event is never reused for a later one: the reported 4 September attack on US targets in Jordan is UNCONFIRMED into a second day and is kept wholly apart from the confirmed 31 August and 1 September Jordan events. \$9.13 also produced this edition's two WITHDRAWALS and four CORRECTIONS, all from re-verification rather than from news (A7). **\$9.15 — both Treasury legs computed and compared, not the satisfied one alone.** \$9.19 and \$9.24 — every denominator named, none spliced: the 59 facilitated against 6 non-facilitated inside one JMIC document; Kpler's visible-commodity universe against Windward's AIS-plus-dark and PortWatch's AIS-only 85/day; FOUR retail fuel series; three payrolls consensus figures; and two Fed-pricing venues on different contracts. \$9.23 — the central negative, and it is stronger than last edition's because the publisher is demonstrably LIVE: fm.gov.om's own footer reads last updated 7 September, and its three items for that date concern a Rwandan state visit and the Arab League. \$9.26 — engaged on two channels at once: on oil, forbidding the resolution of \$9.56 toward whichever Brent series would fire the upgrade; on inflation, forbidding the reverse move of tightening the rule as the margin thins. \$9.30 — the scored gasoline series backfilled UP a fifth consecutive edition and is dark for two sessions after; no trend is read through the gap. \$9.31 — the snapshot missed the US session and the reconciliation is PARTIAL, with every exclusion named. \$9.32 — every superlative bounded against the full column BEFORE writing, which is what produced the careful form of the **\$1.84** claim rather than a false 'nearest of the war'. \$9.36 and \$9.41 — both oil bases quoted, no d/d constructed across the roll. \$9.37 — ENGAGED THREE TIMES: against the whole 7 September rates block, against the DOLLAR INDEX (which looked reconcilable and is a carry), and against the three fields that lost their values. \$9.39 and \$9.40 — Threshold A untestable as written, no tail asserted, three auction legs inside three days. \$9.43 — a visual render was run before delivery. \$9.46 — JMIC 095, the 8–10 September auctions and buybacks, the 9 September EIA retail print and STEO, the 10 September WPSR and PPI, 11 September CPI and the FOMC are **PROSPECTIVE** and are kept out of the **NOT OBTAINED** register. \$9.48 — the identical-value test run at each series' own precision, and the reason it discriminates well on a four-decimal breakeven and poorly on a two-decimal retail price is STATED rather than assumed. \$9.58 — its own prediction TESTED and CONFIRMED: it said there would be no 7 September rate close, and there is none. \$9.50 — re-applied on CME FedWatch, which owes a further method for a **FOURTH** consecutive edition, and the failure has now cost a published figure.

\$9.56 — NOW FOUR CLOSES OLD, AND THE SCORED GAP HAS HALVED IN THREE SESSIONS. A trigger written on a continuation series stops being well-defined the moment the basis opens, and the failure is silent. The oil channel's upgrade is 'Brent above **\$95** sustained'. That rule was written and applied through long stretches in which CO2 and COA printed the SAME NUMBER — most recently exactly zero for twenty consecutive sessions to 28 August. Earlier rolls opened a basis too; what is new is a roll that opened one STRADDLING the trigger. Brent rolled on 31 August and the basis ran 2.12, 3.08, 3.54, 3.89, 3.96, then 3.84 and 3.88. On the 7 September close the trigger falls BETWEEN the two series for a **FOURTH** consecutive session: the scored continuation is **\$1.84** below it and the active contract **\$2.00** ABOVE it. 'Sustained' has a settled operational meaning here — two consecutive confirmed closes, the test that fired US-inflation 4→5 on 31 July and cut oil 2→1 on 3 July. The active contract has now closed above **\$95** FOUR times in succession, so on that series the upgrade condition is met in full and has been since the 3 September close. (!) THE MATERIAL CHANGE THIS EDITION IS THE SIZE OF WHAT IS LEFT. The scored gap has run **\$3.37**, **\$2.68**, **\$1.84** across three sessions, and **\$1.84** is the nearest this series has closed to its trigger since it was last ABOVE it on 24 July. The hold rests on nothing except which of two rising series the rule happens to be written on, and the remaining gap is narrower than the series' own recent daily range. **That is stated plainly rather than dressed up: what settles this is not an argument but two closes. Three things follow and all three remain the practice.** (a) The channel is held on the scored continuation, and the alternative reading is published in the EDITION rather than buried here, because a reader checking a screen quote for 'Brent' will find the active contract. (b) The rule is NOT moved to whichever series would fire it — the \$9.26 discipline. (c) The problem is disclosed as an open methodological question and NOT decided under the pressure of a fired trigger, which is the \$9.16 precedent. The general form, which will recur: any threshold expressed as an absolute level on a rolling series has an undefined region as wide as the basis, and the basis is zero exactly when nobody is looking at it.

\$9.51 — CARRIED FORWARD, UNCHANGED AND UNSETTLED, and STILL six observations deep because 7 September produced no close. When a defective test is met a second time by a different mechanism, record the MECHANISM, not a verdict. \$9.49 recorded Threshold B's 28 August arming as a defect: a long-end stress test tripped by an **11.14 bp** front-end move in which the 30-year contributed **1.25 bp**. On 31 August B held on a bear STEEPENER in which the 30-year contributed the largest move on the curve; on 1 September on a bear FLATTENER in which it contributed the smallest; on 2 and 3 September on a **BULL STEEPENER** twice; and on 4 September on a bear flattener again, in which the 30-year was the ONLY tenor to FALL. (!) The run did NOT extend this edition: there is no 7 September close, so the ordinals are unchanged and the seventh is decided on 8 September. (!) The written test has now returned the same answer through three of the four configurations available, in both directions, and on the latest occasion it was satisfied while its own long-end leg moved TOWARD the threshold, the margin narrowing 4.65 to **4.23 bp** — the test held open by the leg it was not written about. **That is not ambiguity observed twice but six times, and it strengthens rather than resolves the original complaint.** (!) A second observation sharpens it further, and it is new this edition: the two legs DIVERGED for the first time in the run — the 30-year margin narrowed a third consecutive close to **4.23 bp** while the 10-year's WIDENED to **13.21 bp** — so a single test is now being held open by the leg it was not written about. **The open question is unchanged and is not settled here: whether B should be conditioned on a long-end CONTRIBUTION rather than a long-end LEVEL.**

\$9.57 — CARRIED FORWARD FROM LAST EDITION, **UNRESOLVED. A TICKER MAP IS NOT A DEFINITION, AND A SERIES DESCRIPTION IS AN INHERITED CLAIM LIKE ANY OTHER.** This document captioned AUTMUSAG as 'AAA all-grades retail pump' for months, in the tape, the chart, the methodology and the score grid, and scores an entire channel on it against a **\$3.52** anchor and a **\$4.75** trigger. The extract's own description row says only 'US Average Gasoline Price'. (!) The chart legend in \$1.4 has been **CORRECTED** to the vendor's own label this edition — the last place the withdrawn gloss survived. The four rules stand. (a) Re-verify a series DESCRIPTION on the same schedule as an inherited news claim (\$9.13, \$9.23). (b) The failure of a description does NOT impugn the series — AUTMUSAG is continuous, pre-dates the war, and has a stable structural spread to the DOE regular series, a war-long mean of 65.6c in a range of 51.6c to 75.9c on dates where BOTH resolved. (c) DO NOT RE-BASE A SCORED SERIES ON THE EDITION THAT DISCOVERS ITS LABEL IS WRONG (\$9.21, \$9.56b). (d) Publish the irreconcilable numbers side by side with their denominators named (\$9.19) and keep the reconciliation open. (!) It could NOT be advanced this edition either: the DOE corroboration series is dark for a second week because the 7 September survey fell on a federal holiday, and its delayed release is 9 September — **CORRECTED** from the 10 September the last edition published. (!) A **FOURTH** series is now on the record and is not spliced into any of the other three: EIA's own on-highway diesel read **\$5.599** for 31 August against an EIA all-time high of **\$5.810**, so on the EIA series the diesel record has NOT been taken while on AAA's it has been taken three times in four days.

\$9.58 — NEW. **A KNOWN AND BENIGN CAUSE DOES NOT EARN AN EXEMPTION FROM AN INTEGRITY RULE. On the 7 September row six rate fields are identical to four decimal places to their 4 September closes, and the cause is not mysterious: US markets are shut for Labor Day.** The tempting move is to say the check has not really fired — that a holiday carry is a different object from a vendor failing to write a value — and to report the fields as unchanged rather than unresolved. That move is refused, and the reason is that \$9.35 exists precisely because a carry and a genuine unchanged print are INDISTINGUISHABLE IN THE CELL. A holiday explains why this particular carry occurred; it does not make the cell say anything it did not say before, and on 17 August a confident explanation of an identical 30-year print concealed a new **war high**. Three rules. (a) Apply the remedy on the cell's evidence, not on the analyst's theory of the cell — unresolved, no d/d, no reconciliation entry (\$9.37). (b) Publish the cause anyway, because a reader is owed the difference between a market that is shut and an extract that has failed, and because it tells the reader something useful: there will be NO 7 September close for these fields at all, and the next day-on-day comparison runs 4→8 September. (c) Extend the treatment to any field on the same row whose settlement depends on the same closed market, even where the value DID move — here BE10 and the 5y5y, which differ by fractions of a basis point and cannot have settled either. The cost of under-claiming for one session is nothing; the cost of over-claiming is a published record.

\$9.60 — NEW. **A ROW CAN LOSE DATA IT ALREADY HELD, AND NEITHER STANDING ROW-LEVEL RULE ANTICIPATED IT.** \$9.8 tests whether the prior row FAILED TO REFRESH. \$9.10 tests whether a dark cell is later **BACKFILLED**. Both assume the information content of a row is non-decreasing. On 8 September it decreased: WTI CL2 at 88.96, CLA at 91.95 and Henry Hub at 2.929 were all published as 7 September marks in the last edition, from the extract, and all three cells are BLANK in this one — while, on the same row, Brent settled, TTF settled, Asia LNG arrived into a blank cell and the whole rate block carried. A row can therefore settle, carry and REGRESS simultaneously, and a single verdict on the row is meaningless. Four rules. (a) Diff the prior row against the last edition's PUBLISHED figures FIELD BY FIELD, not row by row, and record three outcomes rather than two: settled, carried, **LOST**. (b) A lost cell yields NO close. No day-on-day change may be asserted for it, and the next comparison skips a session — here 4→8 September for those three, which is arithmetically the same treatment the holiday forces on the rate block but for an entirely different reason, and the two causes must not be merged in the prose.

(c) A lost cell yields NO reconciliation entry either, because a reconciliation gap is a published mark minus a settled close and there is no settled close — \$9.37 extended to a third case, alongside carries and restatements. (d) Say that the values existed and are gone, not that they were never there. The published mark is part of this document's record; a reader who compared the two editions would otherwise conclude that this one had simply omitted them. (!) The general form: an integrity rule written for a failure mode you have seen will not fire on one you have not, so state what each rule ACTUALLY tests, and treat a row as a set of independent cells rather than as an object with a single state. That is the same lesson \$9.35 taught about field-liveness, arriving from the opposite direction.

Restatements and comparability. Vendor restatements are normal and make absolute levels non-comparable across editions, though directional analysis is continuous. A contract roll does the same thing to a continuation series silently, which is why the basis check is a standing check. The dual gasoline series is never re-based: AUTMUSAG is the scored reference and preserves the **\$3.52** anchor and the **\$4.75** trigger; USRFRUSA is corroboration only; AAA's published headline is a third series and is never compared with either. The pre-war anchor is the 27 February 2026 close, re-verified field by field every edition; it is unchanged to date. **FOUR OPEN ITEMS REMAIN DISCLOSED RATHER THAN DECIDED.** (1) **FIRST IN LINE AND SHARPER THAN LAST EDITION:** \$9.56, the oil trigger's ambiguity across the roll — **\$2.68** below on the scored series and **\$1.28** through on the active one, with three consecutive closes through on the active series and, for the first time, both series moving the same way. (2) Threshold B's long-end LEVEL versus long-end CONTRIBUTION question, per \$9.49 and \$9.51, now six observations deep with diverging legs and a narrowing 30-year margin. (3) \$9.57, the reconciliation of the scored gasoline series to any published construction, open and un-advanceable this edition. (4) The US-inflation channel's firing-versus-downgrade gap, no longer dormant: the firing trigger has held four closes but the margin has narrowed to **0.82 bp** while the downgrade sits **16.62 bp** lower. The oil channel's own separate asymmetry stands unchanged: its downgrade is written as a mediated pause AND 'a close' at or below **\$72.48** while its upgrade requires a SUSTAINED break, which as written makes the downgrade's PRICE limb easier to trip than the upgrade's, though the downgrade also requires a mediated pause and is not therefore the easier test overall. It is **\$19.84** away and not live.

A10 · ANCHOR AND TRIGGER LEVELS

A10.1 · Pre-war anchor — 27 February 2026 close, re-verified this edition field by field, unchanged

Brent	WTI	2Y	5Y	10Y	30Y	2s10s	5y5y	10y BE	MOV E	VIX	DXY	Gasoline scored	Gasoline DOE	Henry Hub	TTF	Asia LNG
\$72.48	\$67.02	3.3749 %	3.5017 %	3.9375 %	4.6106 %	+55.64 bp	2.142 %	2.2569 %	73.38	19.86	97.608	\$3.52	~\$2.94	\$3.063	€31.23	¥1,669

A10.2 · Live trigger state — the 7 September close for energy, the 4 September close for rates, with events to 8 September

Channel	Score	Upgrade	Downgrade	Distance
Maritime denial	5	At max	Verified reopening AND traffic above 25% of normal for 10 sessions	NEITHER leg advanced and the traffic leg deteriorated sharply. (!) NO JMJC UPDATE 095 EXISTS at the cut, so 094 (ICOD 051500Z) is still operative and its FROZEN count of 101 is SILENT on 6, 7 and 8 September — PROSPECTIVE , not NOT OBTAINED . Hormuz SEVERE , threat levels unchanged. The traffic leg gives four answers again: 094's own annex has 0, 5 and 1 non-facilitated across 3–5 Sep against 59 NCAGS-facilitated over a window it labels 48 hours and elsewhere 72; Kpler's ten-day average COLLAPSED from above 15 on 4 Sep to 10 on 6 Sep, the LOWEST SINCE MAY ; Windward had 11 transits on 5 Sep on an AIS-plus-dark universe; PortWatch is unchanged at 7% of its own 85/day baseline and a week stale. (!) On no denominator does traffic clear 25% of normal — the nearest reading of the war remains UKMTO VRA's 22–23% to 27 August. Blockade tally 87 (3 Sep) → 92 (6 Sep) → 94 (7 Sep), CENTCOM's own count
Oil price shock	2	Brent above \$95 sustained → 3	Mediated pause AND a close at or below \$72.48 → 1	\$1.84 below the upgrade on the scored CO2 close of \$93.16 , NARROWED from \$2.68 — the FIFTEENTH reading, the narrowest of the fifteen, and the nearest this series has closed to its trigger since it was last ABOVE it on 24 July. (!) Bound it against the SERIES , not the reading history (\$9.32): the war's nearest sub-trigger close is \$94.98 of 1 June, two cents away, and every closer reading predates 24 July and sits on the far side of a roll (\$9.36). (!) The ACTIVE contract closed \$97.00 , a FOURTH consecutive close through the level and the highest active close since 22 May, when it settled \$100.21 ; on THAT series the condition is met four times over. \$9.56 is at its sharpest; the rule is NOT moved (\$9.26, \$9.56b). Bounded: TWENTY-SEVEN such COA closes in the war, from twenty-six, and the first RUN of four since a twenty-close run ended 22 May. Downgrade \$20.68 away

Channel	Score	Upgrade	Downgrade	Distance
US inflation impulse	5	At max — fired 4→5 on 31 Jul on a sustained break of 2.30%	5y5y sustained at or below the 2.142% anchor → 4	16.62 bp above the anchor, UNCHANGED, because the last resolved 5y5y close is still 2.3082% of 4 September. (!) THE COUNT OF CLOSSES ABOVE THE 2.30% FIRING LEVEL STAYS AT FOUR: there was no 7 September close. The fourth cleared by 0.82 bp , the narrowest of the four against 1.10, 0.96 and 1.54, and a margin inside a single session's typical move. The 8 September MARK of 2.3030 would leave 0.30 bp , and nothing is claimed on it (\$9.31). (!) \$9.26 has paid TWICE and the rule is not rewritten to the firing level now the margin is thin. BE10 is UNRESOLVED on BOTH rows — carried on a shut market, then identical to four decimals in a live row — so its last resolved value is 2.3532% , 9.63 bp above its own anchor, and no d/d is asserted
Treasury stress	5	At max	30-year close below 5.00% WITH MOVE below 75, sustained → 4	(!) THE VOLATILITY LEG IS UNRESOLVED , NOT SATISFIED A THIRD TIME . MOVE HAS NO PRINT FOR 7 OR 8 SEPTEMBER. Its last close is 73.10 of 4 September, a second sub-75 close and the first below the 73.38 anchor since 28 August; on that close the leg IS satisfied, for a second session. Two sessions of silence are not a third close (\$9.9) — the rule written after MOVE went dark through a 10.9 bp long-end move and the stale low read as calm. Yield leg fails by 24.23 bp on the same close. (!) \$9.18 is not discharged by two closes: this regime's longest sub-75 run is NINE, 18–28 August, ended in one session, and the war's is TWENTY-ONE, 10 June–10 July (\$9.32). (!) CORRECTED : 'the yield leg has never come within 15 bp ' is a claim about the CURRENT REGIME only — the 4.6106% pre-war anchor sits 39 bp INSIDE the condition. (!) The anomaly is restated as of 4 September and no live reading is claimed: volatility 0.28 BELOW its anchor, the 30-year 63.17 bp ABOVE its own
Political stress	5	At max — fired on a sustained break of \$4.75	Three consecutive AUTMUSAG closes at or below \$4.60 with no intervening print above \$4.70 → 4	33 cents above the condition and moving AWAY for a FIFTH edition. AUTMUSAG BACKFILLED to \$4.93 for 4 September — a FIFTH consecutive rise (the last edition's ordinal for \$4.92 is CORRECTED to a fourth) and the highest print since 29 May, expressly NOT a war high (\$5.18 , 20 May) — then DARK on 7 and 8 September and NOT extrapolated (\$9.30). It is 18 cents above the \$4.75 that fired the upgrade, so neither the downgrade nor a reversal is in prospect. (!) THE MEASURE PRODUCED NO OBSERVATION AT ALL ACROSS THE RECORD WINDOW: AAA diesel set fresh all-time highs on 4, 6 and 7 September and the scored series is dark for two of the three. The \$3.52 anchor and the trigger levels are UNCHANGED and the series is NOT re-based (\$9.21, \$9.57c)
Escalation risk	5	At max	Mediated stand-down AND talks resume → 4, or 3 if a reopening is verified	Stood still kinetically and escalated verbally. NO CENTCOM release since 5 September; NO acknowledged US strike on Iranian SOIL since 1 September, a seventh day; NO Iranian attack on any Gulf state since 3 September. (!) Bound the first: the <i>Downy</i> was struck at the Kharg anchorage, inside Iranian territorial waters — a soil-versus-waters distinction, not an absolute. Against that emptiness, three Iranian principals escalated in WORDS on 6, 7 and 8 September; \$9.11 governs and none of them moves the channel in either direction. Two Iranian voices now say a Hormuz arrangement with Oman is days from signature or in its final stages; fm.gov.om, read direct on 8 September, published nothing on it, and its own footer shows the site was updated on 7 September — a LIVE publisher's silence. Washington says it would not recognise such an agreement. NO talks, venue, round or date exists

A10.3 · Stage-4 thresholds — levels and live margins

	Level	State on the 4 September close (the last rate close), with events to 8 September	Margin
A	A coupon auction clearing with a tail above the 1pm when-issued level	NOT ARMED — UNTESTABLE AS WRITTEN (\$9.39), because Treasury publishes no when-issued level. No coupon auction result exists at the cut. The 13 May 30-year stop of 5.050% is a historical marker only; the US has since term-funded at 5.216% (13 Aug). (!) THE TEST IS RUNNING AS THIS EDITION IS WRITTEN: a \$58bn 3-year (8 Sep, same-day), a \$39bn 10-year reopening (9 Sep) and a \$22bn 30-year reopening (10 Sep), all settling 15 September — \$119bn on FOMC day one — with \$246bn of bills also auctioning on 8 September, shifted off Monday by the holiday. Results for NONE of them exist: PROSPECTIVE . NO trend is read against August's \$25bn : reopening vs new issue (\$9.40). (!) CORRECTED : the enlarged long-end buyback does NOT begin 9 September — that is a short-end cash-management operation up to \$12.5bn ; the 10Y–20Y operation is 10 September. Read the allotment composition, never an unsourceable tail (\$9.29, \$9.39)	30-year 19.23 bp above the 13 May stop, from 19.65
B	30-year above 5.20% WITH 10-year above 4.65%	ARMED on the 4 September close, a SIXTH consecutive close — and THE RUN DOES NOT EXTEND THIS EDITION, because 7 September produced no close. The seventh is decided on the 8 September close, which does not exist at the cut. Ordinals UNCHANGED: six armings, five lapses, ELEVEN states and TEN changes since 29 July. (!) On the 8 September MARK both legs clear by 4.44 and 13.62 bp , which would END three consecutive narrowings on the 30-year leg — but a mark arms nothing and the ordinals are NOT advanced on one. \$9.49 stays OPEN, unchanged for want of a session: B has been satisfied across six closes spanning THREE distinct curve shapes — bear flattener, bear steepener and bull steepener — three of the four configurations available	30-year clears by +4.23 bp (from 4.65, from 5.71); 10-year by +13.21 bp (from 11.80, from 12.80). On the 8 Sep MARK, +4.44 and +13.62
C	MOVE above 130	NOT ARMED , and UNRESOLVED SINCE 4 SEPTEMBER — MOVE has no print for 7 or 8 September. On its last close of 73.10, a second sub-75 close and the first below the pre-war anchor since 28 August, the Treasury downgrade's volatility leg is satisfied a second session and NOT a third (\$9.9). (!) The two anchor deviations are reported SEPARATELY and no composite is constructed: they sit on OPPOSITE sides of their anchors — volatility BELOW its own, the 30-year far ABOVE its own — which is the August anomaly of a fully normalised expectation of movement around a yield that has not normalised at all. Both halves are stale and are restated as of 4 September	56.90 below C; 41.92 below the 115.02 war high . MOVE –0.28 vs its 73.38 anchor; 30-year +63.17 bp vs its own
