

ANNEX · 9 SEPTEMBER 2026

This annex is the companion to the 9 September 2026 edition and is built every day. The edition is capped at eight pages; material is RELOCATED here, never deleted. Section numbering tracks the edition: **A1** carries the full commentary for the live-tape tables and the gasoline chart, the full strait-operational record and the freight and war-risk record; **A2.3** the full cross-asset and macro record, the war-powers schedule and the SPR withdrawal; **A7** the source log; **A8** the on-demand update protocol; **A9** the methodology; **A10** the anchor and trigger levels. A figure marked **NOT OBTAINED — or, equivalently, NOT FOUND —** was sought and missed, and is absent from the record rather than unchanged. A figure marked **PROSPECTIVE** relates to a session or publication that had not occurred at the Singapore cut and is not a retrieval failure (§9.46).

A1 · LIVE TAPE — FULL COMMENTARY

A1.1 · Data integrity — \$9.41 CLEARS, \$9.8 CLEARS, \$9.35 fires on ONE field, and \$9.60 DID NOT REPAIR

The extract is 182 rows by 99 columns, history from 31 December 2025, saved on 9 September. The header scan resolves twenty-one tickers and every one of the twenty scored series is present; Brent and WTI auto-detect to **CO2 Comdty** and **CL2 Comdty**, the dollar index to **DXY Index**. No column was inserted or relabelled against the last extract. ¶ **\$9.8, the ROW-level test: CLEARS.** The 8 September row is not identical to the 7 September row on any field, and it carries FOUR values the 7 September row did not hold — WTI CL2, CLA, Henry Hub and MOVE. (!) The count is four and not thirteen because the 7 September rate cells were NOT empty: they CARRIED their 4 September values. A carry and a blank are different states and this document records three outcomes, not two — settled, carried, LOST (§9.60). ¶ **\$9.35, the FIELD-level identical-to-4dp test: CLEARS ON THE 8 SEPTEMBER ROW ENTIRELY** — every field that printed moved — and FIRES ON THE 9 SEPTEMBER ROW ON ONE FIELD, the five-year at **4.5627**, an exact four-decimal repeat of the 8 September close in a row where the two-, ten-, twenty- and thirty-year and the 2s10s all moved. Under §9.35 that is UNRESOLVED regardless of the liveness of its neighbours, and no day-on-day change is asserted for it. (!) The stake is higher than usual and cuts the reassuring way: **the 8 September five-year close is a NEW WAR HIGH**, so the field on which the test fires is the one carrying a record — and because the record sits on the resolved CLOSE rather than on the repeated MARK, the rule costs nothing here. On 17 August the same rule was suspended by an earlier version of this document and a war high was published as a flat print; it is not suspended now. ¶ **\$9.60: THE LOST CELLS DID NOT COME BACK.** WTI CL2 at 88.96, CLA at 91.95 and Henry Hub at 2.929 were published as 7 September marks two editions ago, were blank in the last extract, and are STILL blank in this one. §9.10's two-way backfill test has now been run on them and returned nothing, so the loss has not repaired across two extracts and is treated as permanent unless it backfills — which is a statement about the record, not a prediction. No day-on-day change spans the 7 September cell for those three series: the 8 September close is compared with the 4 September close and the missing session is named, not averaged over. ¶ **\$9.41, the BASIS check: CLEARS.** Brent's continuation-to-active basis ran 3.96, 3.84, 3.54 across 4–8 September and 3.90 on the 9 September mark; WTI's ran 2.91 with no 7 September value, then 2.84 and 3.15. No sign change and no step. (!) Both narrowed into the 8 September close for the first time in this run, so the two contracts moved the same way — which the previous two editions expressly could not say. §9.36 continues to forbid constructing any change across the two Brent series. ¶ **\$9.58 no longer applies.** The holiday carry that governed the 7 September row is spent: 8 September was a full session, US markets were open, and every rate field settled. The 7 September row remains what it was — six rate fields, the 2s10s, the dollar index and AUTMUSAG carried from 4 September; BE10, the 5y5y and the VIX moved on a shut market and could not have settled — and nothing in this edition is scored on it. ¶ **\$9.48, stated rather than assumed.** AUTMUSAG's 7 September cell repeats **\$4.93** exactly. It is a TWO-decimal retail series that repeats genuinely — **\$4.82** ran four consecutive sessions from 21 to 24 August — so an exact repeat carries very little of the improbability the rule relies on, and it is being applied where it discriminates weakly. It is applied anyway because nothing turns on it: the distance to the **\$4.60** condition is **33 cents** on either reading. ¶ The 27 February 2026 anchor was re-verified field by field against this extract and is **UNCHANGED**: Brent **72.48**, WTI 67.02, 2Y 3.3749, 5Y 3.5017, 10Y 3.9375, 20Y 4.5505, 30Y 4.6106, 2s10s 55.64, BE10 2.2569, 5y5y **2.142**, MOVE 73.38, VIX 19.86, DXI 97.608, gasoline **3.52**, Henry Hub 3.063, TTF 31.227, Asia LNG 1.669. No restatement was found anywhere in the last ten rows.

A1.2 · Reconciliation of the 8 September snapshot — the FULLEST of the last five editions, and it missed in one direction

FIFTEEN tape fields were published as 8 September marks in the last edition, and FOURTEEN of them can be reconciled against a settled 8 September close. (!) ONE is excluded by name. Four further series carried NO 8 September mark at all and therefore never entered the count. That is the fullest reconciliation this document has published since 3 September, and it is a direct consequence of a normal trading session replacing a holiday. Levels in the series' own units; rate gaps in basis points.

Field	Published mark, 8 Sep	Settled close, 8 Sep	Gap	Reading
Brent CO2	93.32	94.38	+\$1.06	(!) The largest crude gap since 7 August, and it is 1.7 times the entire remaining distance to the \$95 upgrade. A snapshot that can be a dollar wrong in one session cannot adjudicate a 62-cent question, which is why the 9 September mark of \$95.61 is reported and not acted on
Brent COA	97.20	97.92	+\$0.72	Same direction, smaller magnitude — so the basis NARROWED into the close, from 3.88 on the marks to 3.54 on the closes
WTI CL2	89.46	90.19	+\$0.73	Reconcilable even though the SAME SERIES has no 7 September close: \$9.60 removes a session, not a field
WTI CLA	92.53	93.03	+\$0.50	The narrowest energy gap on the table
Henry Hub	2.956	2.916	−\$0.040	(!) The ONLY energy field to settle BELOW its mark, and the only ENERGY series below its pre-war anchor. The regional split held through the session
TTF	73.990	75.841	+€1.851	(!) The mark was already above the standing record and NOTHING was claimed on it (\$9.1); it settled €1.851 HIGHER still, and the record was taken on the close. The same discipline saved this document on 7 September when the mark was above the record and settled €1.549 lower
2-year	4.3727	4.3936	+2.09 bp	The largest rate gap, and the front of the flattener
5-year	4.5502	4.5627	+1.25 bp	(!) The mark was BELOW the standing war high and the close is ABOVE it. Nothing was claimed on the mark
10-year	4.7862	4.7882	+0.20 bp	Almost exactly reconciled
20-year	5.2482	5.2521	+0.39 bp	Unscored, tabled here for completeness
30-year	5.2444	5.2454	+0.10 bp	The smallest gap on the table. The long end was the least mis-read part of the snapshot, which is the OPPOSITE of the usual pattern (\$9.12)
2s10s	41.144	39.252	−1.892 bp	Consistent BY CONSTRUCTION with the two tenors and not an independent observation
5y5y forward	2.3030	2.3119	+0.89 bp	The mark would have left the forward 0.30 bp above its firing level; the close leaves it 1.19
Dollar index	98.806	98.787	−0.019	Effectively reconciled. (!) Last edition the dollar LOOKED reconcilable and was a carry; this edition it is a genuine settle, and the difference is that the market was open

ONE FIELD IS EXCLUDED BY NAME, AND THE EXCLUSION IS THE POINT (\$9.37); FOUR MORE HAD NO MARK TO RECONCILE. ¶ BE10 is excluded because this document published its 8 September mark as **UNRESOLVED**. A reconciliation gap is a published mark minus a settled close; where the mark was an exact four-decimal repeat and was reported as carrying no information, a gap computed against it would measure staleness in the extract rather than the timing of the Singapore cut. It settled at **2.3751%**, which against the repeated 2.3536 would have read as a **+2.15 bp** gap — the **LARGEST** rate miss on this table, ahead of the 2-year's +2.09. It is not a miss; it is the rule working. ¶ **MOVE, the VIX, Asia LNG and AUTMUSAG are excluded because no 8 September mark existed to reconcile** — all four were dark in the last extract. MOVE settled 76.14, the VIX 15.72 and Asia LNG ¥3,975; AUTMUSAG is still blank. ¶ **THE DIRECTION IS THE FINDING**. The 2s10s is not an independent observation — it is the ten-year minus the two-year — so the tally is run on **THIRTEEN** independent fields: **ELEVEN settled ABOVE their marks and TWO below**, those two being Henry Hub and the dollar index. The 2s10s, counted separately, also settled below. The Singapore-morning cut **UNDERSTATED** the session across crude, European gas and the whole nominal curve. (!) \$9.31 was written on the mirror image of this — a snapshot that missed an entire US session in ONE direction and killed four headline claims by the close — and the lesson is symmetric: a cut that is systematically one-directional in a rallying tape will make the oil gap look **WIDER** than it is on the morning and **NARROWER** once it settles. (!) **THAT FINDING CUTS AGAINST THIS DOCUMENT'S OWN CAUTION AND IS PRINTED ANYWAY**. If the morning cut systematically **UNDERSTATES** a rallying tape, then **\$95.61** is a conservative reading of the 9 September close rather than an unreliable one, and the reconciliation is an argument **FOR** the mark, not against it. The channel is held regardless, and the reason is the rule and not the arithmetic: **a mark is not a close**. This edition is therefore reporting a 62-cent gap that a single ordinary session can erase, and declining to act on a mark that is already through the level, on a rule it will not bend in the direction the evidence points.

A1.3 · Energy and gas — full commentary

BRENT. The scored continuation closed **\$94.38**, up **\$1.22**, its largest close-to-close rise since 1 September and its highest close since 24 July. The distance to the **\$95** upgrade has run **\$3.37** (3 Sep), **\$2.68** (4 Sep), **\$1.84** (7 Sep), **\$0.62** (8 Sep): **82%** of it closed in four sessions, and the gap is now smaller than the largest single-day move within that same run. Two sessions ago the honest reading was that the gap exceeded twice a normal day; that reading is now obsolete and is retired rather than requoted. The 9 September mark is **\$95.61**, **61 cents** above the level, the first mark on this series above **\$95** since 24 July. It moves nothing. ¶ **The active contract closed \$97.92**, up **\$0.92**, a FIFTH consecutive close above **\$95** and the highest active close since 22 May, when it printed **\$100.21**. That is the twenty-eighth COA close above **\$95** in this war. On the active contract the upgrade condition — a sustained break, which this instrument has always read as two closes — was met on 3 September and has been met on every session since. (!) The channel is held on the continuation and the alternative reading is printed in the tape, in the score grid, in §2.1 and in the watchlist. A reader who checks a screen quote for 'Brent' will find the active contract and can see exactly why the two answers differ. ¶ **\$9.36 STILL BINDS ON THE JULY PRECEDENT.** The continuation closed **\$100.69** on 23 July and **\$96.78** on 24 July, two consecutive closes above **\$95**, and no upgrade fired — because on those same two days the active contract closed **\$94.26** and **\$91.68**, both below the level, and the basis has since inverted. The safe formulation stands: the last two closes above **\$95** on the scored series sit on the far side of a July roll on which the active contract never cleared the trigger. What is coming now is different in kind, because BOTH series are above or at the level together. ¶ **WTI.** CL2 closed **\$90.19** and CLA **\$93.03**, both up strongly from 4 September with no 7 September close on either. No trigger is written on WTI. The basis narrowed from 2.91 to 2.84. ¶ **HENRY HUB \$2.916**, and it is the whole regional argument in one number. It closed **4.80%** BELOW its **\$3.063** pre-war anchor, and the discount WIDENED from 2.87% on the last resolved close. It is the only ENERGY series on this tape trading below where it started the war — the VIX and SOFR are also below their own anchors and are not energy. American gas is cheaper than before the strait closed while European gas has more than doubled and Asian gas has more than doubled: that is a routing and loading shock, not a global energy shock. (!) The cleanest published measure is the pair of deviations from each series' OWN anchor — Henry Hub **−4.80%** against TTF **+142.9%** — and NOT any 'gap' between them, which are quoted in different currencies and different units and cannot be subtracted (\$9.19). ¶ **DUTCH TTF €75.841 — A FIFTEENTH WAR-RECORD CLOSE AND THE FIRST OF THIS WAR ABOVE €75.** It rose **€2.535** on the session and **€3.889** from the 4 September close, and took out the **€73.634** of 2 September by **€2.207**. Against the **€31.227** anchor it is **+142.9%**, the largest multiple on the tape. The reported drivers are four and no wire attributes the move to one: European storage running well below its five-year seasonal norm; a Qatari LNG force majeure extended into early November, with Hormuz carrying about a fifth of global LNG shipments; Norwegian pipeline maintenance, which this document could not tie to a named field outage in this window; and Asian buyers bidding for the same cargoes. (!) The 9 September mark of **€76.770** is above the new record and NOTHING is claimed on it — the same discipline that was vindicated on 7 September, when a mark above the record settled **€1.549** lower. ¶ **ASIA LNG ¥3,975**, down 35 from the **¥4,010** of 7 September, **+138.2%** on pre-war, with no 9 September print. (!) **CORRECTED (\$9.32): ¥4,010 was the TWELFTH war-record close of this series, not a thirteenth.** The ordinal was carried from the last edition and is one too high; the full column was re-run and the war-record sequence is 2,393 (3 Mar), 3,005, 3,192, 3,430, 3,499, 3,601, 3,628, 3,680, 3,793, 3,944, 3,960 and 4,010. A superlative inherited from a prior edition is exactly as suspect as a new one.

A1.4 · Strait operational — the full record, every provider, every denominator

Strand	Reading, with its own denominator	Date	Source and tier
JMIC cumulative incidents	(!) 101 confirmed incidents since 1 March 2026. THIS IS AN INCIDENT COUNT, NOT A TRANSIT FIGURE , and the last edition described it as a frozen transit count — CORRECTED . Hormuz threat level SEVERE , Gulf of Oman MODERATE , both unchanged from 093	ICOD 051500Z, published 6 Sep	JMIC Update 094 PDF, TIER 1
JMIC transits	59 vessels through Hormuz in the 3–5 September 48 hours, US-facilitated; 117 through Bab el-Mandeb in 72 hours. A FACILITATED SUBSET, not total traffic	3–5 Sep	JMIC Update 094, TIER 1
JMIC 095	DOES NOT EXIST at the cut, a second consecutive edition. Three direct URL probes for 7, 8 and 9 September returned 404; the JS-driven product index renders nothing. PROSPECTIVE , not NOT OBTAINED . (!) It therefore does not record the American strikes of 8 September either	checked 9 Sep	ukmto.org read direct, TIER 1
UKMTO damage incidents	27 projectile-strike incidents resulting in vessel damage since 6 July. A cumulative damage count — not a rate, not transits, and never added to the 101	7 Sep	UKMTO via Reuters, TIER 1
Kpler daily	6 commodity vessels, most via the Iranian route rather than the US-escorted corridor. Universe: commodity vessels with ACTIVE AIS transponders; dark transits excluded by construction	6 Sep	Kpler via Reuters, TIER 1
Kpler 10-day average	a ten-day MEAN of 10/day — a MEAN, not a daily count, which Kpler calls its lowest since May on no published numeric May baseline — so the superlative is the PROVIDER'S and is not independently checkable. Preceded by readings of 15+ (4 Sep) and about 13 (5 Sep). (!) A ten-day mean cannot fall five points in two sessions, and the reason is that these are not one statistic: 15+ and 13 are DAILY counts and 10 is a ten-day MEAN. They are never printed as a sequence and NO rate of change or direction is computed across them. Its own recent baseline is ~14/day and its pre-war ~130–140/day	4–6 Sep	Kpler via Reuters, TIER 1
Windward	12 transits — 7 inbound, 5 outbound — with ZERO dark crossings : all transiting vessels AIS-transmitting. Universe: cargo and tanker vessels transmitting AIS. Publishes no baseline, so no percentage of normal is computable on it and the 25% test is UNTESTABLE here	6 Sep	Windward MIOC, TIER 2
Lloyd's List Intelligence	~12 transits/day. Universe: cargo-carrying vessels over 10,000 dwt	26 Aug–1 Sep	Lloyd's List Intelligence, TIER 2
IMF PortWatch	7% of its own ~85/day baseline. (!) The same week reads as a different percentage on Kpler's 130–140 baseline; a percentage of normal without its baseline named is meaningless (\$9.19). TIER 3, dated 30 August, UNREFRESHED — and it is labelled so wherever it appears, including in the edition	30 Aug, unrefreshed	via aggregator, TIER 3
CENTCOM blockade tally	94 commercial vessels redirected, 3 disabled, 2 boarded. Series: 87 (3 Sep), 92 (6th), 94 (7th). (!) Issued on CENTCOM's X account, NOT by press release. NO 8 or 9 September figure — NOT FOUND . (!) The '100 ships' milestone belongs to 23 MAY on a DIFFERENT counting basis and is never joined to this series	as of 7 Sep	CENTCOM via X, relayed, TIER 2
US-escorted counts	30–40 ships and 10–18 mb/d CLAIMED by US officials — a claim by a party to the conflict. A different measurement entirely — escorted vessels, universe undefined, possibly including naval auxiliaries and dark transits. (!) The gap to the tracker range of 6–12 is a DEFINITIONAL artefact and is not asserted to be a discrepancy of fact	late Aug–3 Sep	US officials, TIER 2
VLCC movement	No VLCC exit 3–7 September on Kpler's VISIBLE universe. (!) The unqualified form of this claim was WITHDRAWN last edition and stays withdrawn: a dark hull cannot appear in a visible count	3–7 Sep	Kpler via Reuters, TIER 1

A1.4a · Primary text — the statements the judgment rests on, verbatim

CENTCOM, 8 September (TIER 1 as a primary document, but a battle-damage claim by a PARTY TO THE CONFLICT, uncorroborated by any allied product): 'U.S. Central Command (CENTCOM) forces destroyed five Iranian crude oil carriers, Sept. 8, after the Islamic Revolutionary Guard Corps (IRGC) targeted a U.S. Navy warship with ballistic missiles twice over the past two days.' Vessels named: Kaviz, Charminar, Horizon 1 and Riesco in the Gulf of Oman; Derya near Kharg Island. Adm. Brad Cooper, quoted in the same release: 'If you shoot at two of our ships, we will impose an even higher economic cost — taking out three of yours.' (!) The quoted **RATIO** — three for two — describes the 5 September action, not the five-vessel one the same release announces; the mismatch is recorded and not reconciled. (!) **METHOD NOTE, AND IT IS THE REASON THE LAST EDITION WAS WRONG: the CENTCOM release index served a stale listing topping out at 5 September on repeated fetches, and this item was reachable only with an explicit page parameter.** ¶ **JMIC Update 094, 6 September (TIER 1):** 'Due to recent Iranian attacks, the threat level remains SEVERE, with deliberate hostile action considered as highly likely under current conditions' for the Strait of Hormuz; 'The threat level remains MODERATE' for the Gulf of Oman. ¶ **Oman-Iran joint statement, 23 June 2026 (TIER 1, fm.gov.om) — still the most recent Omani text on the strait, eleven weeks old:** the parties will form 'a joint working group between the two foreign ministries in order to reach agreement on the future administration of navigation in the Strait of Hormuz', and 'All arrangements related to the Strait of Hormuz must fully respect the sovereignty and sovereign rights of the two Coastal States.' ¶ **Oman's foreign minister, reported 6 September (TIER 2, signed newspaper article):** no solution has been reached, but Oman is 'not walking away'; 'The task of the diplomat — perhaps especially the diplomat from a small nation — is to be the persistent interlocutor who remains at the table even when there seems to be nothing left to explore.' (!) This is the ONLY Omani ministerial word in the window and it is not an MFA statement. ¶ **Iran, SNSC secretary Mohsen Rezaei, 7-8 September (TIER 3, state media):** 'The maps of a new international corridor which lies in Iranian and Omani waters and in which Iran will have management have been agreed and should be signed in the coming days'; the announced zone 'will start from the US Navy's blockade line and include areas of the Persian Gulf... Any ship entering this new zone will be placed on the sanctions list.' (!) NO coordinates have been published. ¶ **Iran, foreign ministry spokesman Esmail Baqaei, 7 September (TIER 3):** Iran's actions in the strait are 'quite defensive'; the strait and the Gulf 'have been rendered insecure... as a direct result of US-Israeli belligerence.' He said separately that the understanding would be registered with the IMO 'in the coming days'. (!) One aggregator headline states the filing has HAPPENED; its own body text says it has not, and **no filing is asserted here.** ¶ **US Treasury Secretary, 8 September (TIER 1):** 'Let this be a warning to anyone doing business with Iran's remaining airlines... You are at risk of being cut off from the global financial system.' ¶ **US Secretary of State, 8 September (TIER 1), on the Saudi attacks:** 'The Houthis in many ways are agents and proxies of the Iranians. I think behind some of this is clearly the Iranian hand.' (!) An attribution by a party to the conflict. It is recorded and is NOT treated as establishing Iranian direction of the 8 September attacks. ¶ **US President, 7 September (TIER 1 relay):** oil prices will drop 'precipitously... when we WIN the war with Iran', to 'Three Dollars a gallon, but ultimately, below Two Dollars a gallon.'

A1.5 · Retail fuel — FIVE series, never compared, and a record run that ended by three hundredths of a cent

Series	Level	As of	Its own record, and the distance
AUTMUSAG — the SCORED series	\$4.93	4 Sep (last resolved)	War high \$5.18 , 20 May 2026 — 4.83% below. (!) This is the series the \$3.52 anchor, the \$4.75 trigger and the \$4.60 condition are written on. Its vendor description is 'US Average Gasoline Price' and the 'AAA all-grades' caption this document once used remains WITHDRAWN (\$9.57)
USFRUSA — DOE regular retail spot	\$4.071	31 Aug	War high \$4.50, 11 May. Weekly, surveyed Monday; the delayed release due 9 September had NOT published at the cut. Spread to AUTMUSAG on dates where BOTH resolve: war-long mean 67.3c , range 60.3c–75.9c across 27 observations. (!) The two levels printed in this table imply 85.9c, OUTSIDE that range — because they are five days apart and the spread is only defined where both resolve on the same date. No spread is asserted from them
AAA national regular	\$4.1514	8 Sep	All-time record \$5.0165 , 14 June 2022 — 17.2% below. (!) CORRECTED: the \$5.18 of 20 May belongs to AUTMUSAG and is NOT an AAA record; the last edition set the two in adjacent sentences and they must never be joined
AAA national diesel	\$5.9012	8 Sep	(!) THE RECORD RUN ENDED. All-time record \$5.9015 , set 7 September 2026 — and the 8 September print is three hundredths of a cent BELOW it, a first down-day after highs on 4, 6 and 7 September. (!) 5 September carried no fresh high and is not a missing observation. The record STANDS at the 7 September level; it was not taken a fourth time. The superseded 2022 figure is no longer displayed by AAA and no date is asserted for it
EIA on-highway diesel	\$5.599	31 Aug	EIA all-time high \$5.810 — so on the EIA survey the record has still NOT been taken. Different survey, different universe, and it is never spliced with the AAA series (\$9.19)

THE WEEKLY PACE, ON AAA'S OWN BASE. Against its week-ago figures, diesel is +26.87c and regular +5.60c — **4.8 times** the pace — a fourth consecutive edition in which diesel outpaces regular by roughly five to one, on a ratio recomputed each edition rather than carried. (!) The 9 September national averages had not posted at the cut; two direct fetches both returned the 8 September figures. ¶ **THE SCOPE QUESTION, RESTATED AND LEFT OPEN.** AUTMUSAG is a GASOLINE series; the records were in DIESEL; the political channel cannot register a distillate record BY CONSTRUCTION. That is a scope choice, not an instrument failure, and the difference is not rhetorical: a series that tracks its own subject faithfully while a different subject moves has no defect (\$9.61). Whether the channel should be scored on a distillate series is a real question. It is NOT decided here, and \$9.21 and \$9.56b are the reason — an edition that is watching the record it cannot see reverse is the worst possible moment to re-base a scored series. ¶ **THE CAUSE remains a refining and distillate constraint rather than a crude one,** on the 28 August week: distillate stocks **104.2 mn bbl**, about **14%** below the five-year average, against refinery utilisation of **98%**; East Coast distillate at **19.318 mn bbl**, the lowest in a weekly series beginning in 1990. A Russian diesel export ban extended on 29 August to 30 September is a second driver and this document does not apportion between them.

A1.5a · US retail fuel chart — relocated from §1.6

Both charted lines are GASOLINE. Navy is AUTMUSAG, the scored series, daily, ending 4 September at **\$4.93** and NOT extrapolated through the three unresolved cells that follow. Amber is USFRUSA, DOE regular retail spot, weekly, ending 31 August at **\$4.071**. The dotted line is the **\$4.75** level whose break fired the political channel 4→5 on 4 August. (!) **Neither line is AAA diesel, and no trigger in this document is written on diesel.**

US retail gasoline, two series, 1 January 2026 to date. Pre-war marks: AUTMUSAG \$3.52 at 27 February; USRFRUSA \$2.94 at 23 February.

A1.6 · Freight, war risk and ports

WAR RISK — AND THE ARITHMETIC IS PUBLISHED IN FULL THIS TIME. The freshest attributable TIER 1 quotation remains a global marine broker's of 22 July 2026: Hormuz war-risk cover at 7.5%–10% of hull value, up from 1%–3% weeks earlier, with Bab el-Mandeb at 0.5%. (!) **THE BROKER DID NOT STATE A HULL VALUE, so the dollar figure is a RANGE OF SCENARIOS and not a quotation:** on a \$150m VLCC that rate is \$11.25m–\$15.0m per transit; on a \$100m hull it is \$7.5m–\$10.0m. Both are printed and neither is asserted as the market price. This is the third form of the same figure this document has published and the correction history matters: a \$3m–\$10m pairing was withdrawn on 8 September as wrong by a factor of 2.5 at the low end, and the error was arithmetic, not sourcing — 7.5% of any hull between \$100m and \$150m cannot be \$3m. (!) No war-risk quotation dated 6–9 September was found; the trade press that carries them refuses a fetcher. A widely-relayed aggregator figure of a 40× pre-crisis multiple and about \$10m per VLCC transit is TIER 3 with undisclosed provenance and is recorded, not used. ¶ **FREIGHT.** The last obtained reading is week 36: TD3C at WS 677.22, a round-trip time-charter equivalent just under \$704,000/day, against TD34 Gulf of Oman–China at just over \$261,800/day — so the Gulf-of-Oman voyage earns about 37% of the in-Gulf round trip — **entering the Gulf proper commands roughly 2.7 times loading outside it**, which is the cleanest published measure of the premium. (!) **IT WAS NOT REFRESHED THIS CYCLE and is carried with its date rather than repeated as current (\$9.13).** ¶ **KHARG.** The island handles about 90% of Iran's crude exports and lies 483 km north-west of Hormuz. Its western terminal reloaded on 12 August after 25 days empty. (!) The American strikes of 5 and 8 September were on tankers NEAR Kharg; **no source states the terminal itself was struck or that loadings halted, and neither is asserted.** Iranian workarounds on the record: ship-to-ship transfer at the North Larak anchorage, and a Caspian route on which wet-cargo shipments rose from 8 to 23 across two comparable 164-day windows, on a vessel-count basis. Saudi Aramco separately shifted volumes to ship-to-ship at Fujairah and Sohar from 31 August, at least four million barrels, some with tracking disabled. (!) No Iranian crude export volume for 6–9 September was found — **NOT OBTAINED.**

A2.3 · CROSS-ASSET AND MACRO RECORD — FULL

A2.3.1 · One trading session, a clean bear flattener, and a war high in the belly

The window contains ONE settled US trading session, 8 September: 5–6 September was a weekend and the 7th a federal holiday, which is a closed day and not a session. Every rate move below therefore spans ONE settled session across FOUR calendar days, from the 4 September close, and is labelled as such rather than as a day-on-day change. ¶ **THE SHAPE IS A CLEAN BEAR FLATTENER AND IT IS MONOTONIC WITH TENOR.** 2Y +2.75 bp, 5Y +1.79, 10Y +0.61, 20Y +0.52, 30Y +0.31 — each smaller than the one before it — with the 2s10s spread –2.14 bp to 39.252, the flattest close since 28 August and 16.39 bp flatter than the 55.64 pre-war anchor. (!) The monotonicity is stated ONLY because it was checked: the last edition's draft asserted a monotonic flattener on figures that contradicted it, two adversarial reviewers caught it independently, and the claim is now recomputed from the extract every edition rather than inherited. ¶ **THE FIVE-YEAR CLOSED 4.5627%, A NEW WAR HIGH**, taking out the 4.5551 of 1 September by 0.76 bp. Every other tenor's war high survives: the 2-year's 4.3998 by 0.62 bp, the 10-year's 4.7981 by 0.99 bp, the 20-year's 5.3016 by 4.95 and the 30-year's 5.3060 by 6.06 bp. (!) The 9 September mark repeats the five-year to four decimals and is UNRESOLVED under \$9.35, so the record is neither extended nor confirmed by it and no d/d is asserted. ¶ A front-and-belly-led flattening into an FOMC that markets price for a HIKE is a policy-path curve. It is NOT the shape a war-driven term-premium story predicts, which would put the move in the long end; the 30-year rose a third of a basis point. That distinction is the difference between the Gulf repricing American inflation and the Gulf repricing the September meeting, and on this session it is the second. ¶ **INFLATION COMPENSATION ROSE, AND THE STANDING CLAIM IS RETIRED.** BE10 closed 2.3751%, up 2.19 bp from the 4 September close and its highest close since 4 June, 11.82 bp above its 2.2569 anchor. The 5y5y forward closed 2.3119%, up 0.37 bp, a fifth close above its 2.30% firing level. For three editions this document reported ten-year compensation as flat, bounded explicitly to 4 September, and warned that the diesel records and the \$97 active close fell after that date and were untested by any reading it held. One close has now tested them and compensation rose. **One close is a session, not a regime (\$9.18)**, and no re-anchoring inference is drawn from it — but the flat-compensation framing cannot be repeated as though nothing had happened, and it is retired rather than requested. ¶ **VOLATILITY AND THE DOLLAR.** MOVE resolved at 76.14 after going dark on the 7 September row and on the 8 September mark row — two dark ROWS, one missed session — 2.76 points ABOVE its 73.38 pre-war anchor, having been 0.28 below it on 4 September. The VIX closed 15.72, +1.19 on the 4 September close and its first RESOLVED rise since then — the 7 September cell moved on a shut market and is unresolved — still 20.8% below its own anchor; the 14.25 low of 14 August stands. The dollar index closed 98.787, down 0.389 and its lowest close since 13 May, still 1.18 above pre-war. (!) A weaker dollar alongside a rising crude price makes the barrel dearer in every currency except the one the trigger is written in; it is noted and no trigger is written on it. SOFR is blank on the 7, 8 and 9 September rows — a genuine blank, not a carry — last resolved 3.65 on 4 September.

A2.3.2 · The data calendar — what has landed, what has not, and the difference

NO SCHEDULED US MACROECONOMIC DATA WAS RELEASED BETWEEN 5 AND 9 SEPTEMBER. (Plenty else was: the OPEC decision of the 6th, JMJC 094, the CENTCOM release of the 8th, the 3-year and bill auction results, Oman's three items and the daily AAA prints all fall inside it.) The August employment report — **+162,000** payrolls, unemployment **4.1%**, well above expectations — was published on 4 September and sits **OUTSIDE** this window; it is the last hard US datum in circulation and is not re-reported here as news. ¶ Ahead: **August PPI on 10 September** and **August CPI on 11 September at 08:30 ET**, both inside the FOMC blackout, and the **FOMC on 15–16 September** with a Summary of Economic Projections. (!) NO consensus forecast for August CPI could be sourced — **NOT OBTAINED**, and a consensus this document cannot name is not quoted. ¶ **THREE PUBLICATIONS WERE DUE INSIDE THIS WINDOW AND NONE HAD PUBLISHED AT THE CUT.** The EIA weekly retail gasoline and diesel print, delayed by the federal holiday to **9 September**; the EIA **September Short-Term Energy Outlook**, scheduled for the same day; and the Weekly Petroleum Status Report, pushed to **Thursday 10 September** at 12:00 and 14:00 ET rather than the usual Wednesday. All three are **PROSPECTIVE** — a session or publication that had not occurred at the Singapore cut — and **NOT OBTAINED**. The distinction is the whole of \$9.46 and it is the difference between a fact about the world and a fact about the fetch. ¶ (!) One closed federal day has now produced FOUR separate downstream effects: no rate close on 7 September, the WPSR pushed to the 10th, the retail print pushed to the 9th, and the week's bill auctions shifted off Monday onto Tuesday. None of them is a retrieval failure.

A2.3.3 · Fed pricing — a confirmed silence, and five venues that cannot be joined

NO FEDERAL RESERVE SPEECH OCCURRED BETWEEN 4 AND 9 SEPTEMBER. That is a **CONFIRMED ABSENCE** rather than a retrieval failure: the FOMC blackout opened on 5 September. The last word before it was a governor's on 3 September, and it cuts **AGAINST** the pass-through thesis — his earlier worry that higher energy prices would bleed into many goods and services prices 'hasn't come to pass, at least so far'; he added that it might not take much acceleration to nudge him toward supporting tighter policy, and that his vote turns on the August inflation data. Those two sentences are the whole September debate and they are **HIKE-versus-HOLD**, not **hold-versus-cut**. ¶ **THE PRICING SUPPORTS A SIGN, NOT A NUMBER, AND CERTAINLY NOT A DIRECTION.** Every sourceable reading, each with its own venue, contract and timestamp, never averaged, chained or joined (\$9.19):

Venue and basis	Reading	Dated
Prediction market, that contract	25 bp hike 52% · no change 48% · cut under 1%. (!) The three legs as relayed sum above 100; they are printed verbatim and NOT normalised	8 Sep
Fed funds futures, expanding-tree model	57.4% hike · 42.6% unchanged · 0.0% cut	8 Sep
Two prediction markets, relayed	44.5% hold on each — but on contracts whose stated volumes differ by a factor of five, so they are NOT the same market	9 Sep
Cross-venue volume-weighted construct	54.2% hike. (!) A DERIVED figure, not a venue reading, and it is recorded rather than used	9 Sep
Futures tool, relayed	66% hike	31 Aug

(!) The two readings taken on the **SAME DAY** — 52% and 57.4% on 8 September — disagree by about five points on the same question, which is itself the argument against quoting any single one as the market. **The WITHDRAWAL of the 48.4% → 58.4% pair stands, and so does the withdrawal of any DIRECTION for hike pricing:** the sourceable relays do not form a series. What survives re-verification is the **SIGN**: every venue prices a hike or a hold and none prices a cut above 1%, the futures-implied model putting it at zero. (!) A market pricing tighter policy into an energy shock **WOULD BE** a mechanism by which the Gulf reaches the front end of the curve, and the flattener above is consistent with it — but this pricing cannot test that hypothesis and it is stated as a hypothesis, not a finding.

A2.3.4 · Treasury supply — the first leg cleared, and two Treasury documents disagree

THE 3-YEAR CLEARED AND THE COMPOSITION IS COMFORTABLE. The \$58bn 3-year note of 8 September cleared at **4.474%** with a bid-to-cover of **2.72** and no SOMA add-on. Allotment on the **COMPETITIVE-ACCEPTED** denominator of **\$57.619bn**: indirects **\$35.809bn = 62.15%**, directs **\$15.525bn = 26.94%**, primary dealers **\$6.285bn = 10.91%**. (!) On the alternative denominator, total award ex-SOMA of **\$58.000bn**, the same three read 61.74%, 26.77% and 10.84%. **Both bases are defensible, they differ by about 0.4 points on indirects, and a share on one basis is NEVER compared with a share on the other (\$9.40).** ¶ Read the composition, not a tail (\$9.29): **a dealer take under 11% against directs at more than a quarter of the issue is paper absorbed by end buyers rather than by the backstop.** (!) **NO TAIL IS ASSERTED AND NONE CAN BE.** Treasury publishes no when-issued level, a tail is the clearing yield minus a 1pm dealer datum, and the correct state for Stage-4 Threshold A is therefore **UNTESTABLE AS WRITTEN** rather than 'does not arm' (\$9.39). The standing method is the fiscaldata auctions endpoint, which returns full primary internals; the TreasuryDirect PDF endpoints return empty to a fetcher. ¶ **STILL TO COME IN THE SAME WEEK:** a **\$39bn** 10-year reopening on 9 September and a **\$22bn** 30-year reopening on the 10th — **\$119bn** of coupons in total, ALL settling 15 September, the first day of the FOMC. Results for neither exist at the cut: **PROSPECTIVE**. Bills auctioned on 8 September, shifted off Monday by the holiday: 13-week **\$92bn** at a 2.61 cover, 26-week **\$79bn** at 2.88, 6-week **\$75bn** at 2.93. (!) Bill totals **EXCEED** their offerings because of SOMA add-ons of **\$7.068bn**, **\$6.069bn** and **\$5.762bn** respectively, and SOMA must be subtracted before any percentage is computed. The bill total is stated beside the coupon total and never merged with it. ¶ **THE BUYBACK CONFLICT IS NOW SOURCED ON BOTH SIDES AND IS NOT RESOLVED HERE.** Treasury's press release of 19 August raises long-end liquidity-support buybacks from **\$2bn** to 'at least **\$4bn**' per operation for the 10Y–20Y and 20Y–30Y buckets, 'effective September 9, 2026 and... for the remainder of this refunding quarter'. Its own Tentative Buyback Schedule still lists **\$2bn** for the 10 September 10Y–20Y operation, and the updated schedule that release promised has NOT been published. (!) Both are primary Treasury documents and they disagree; **no size is asserted for the 10 September operation.** The last edition's correction stands and is refined: the **ENLARGEMENT** takes effect on 9 September; the enlarged **LONG-END** operation is on the 10th; the 9 September operation is a **SHORT-END** cash-management buyback of nominal coupons 1 month to 2 years, up to **\$12.5bn**, results not published at the cut. The 3 September operation of the same kind took its full **\$12.5bn** against **\$28.272bn** offered, a 2.26× cover.

A2.3.5 · The physical balance, the SPR, and a test that has answered

\$9.28'S FOLLOW-UP TEST HAS RUN, AND ON THE LEVEL IT DOES NOT DISCRIMINATE. In August this document reported a **+17.4 mn bbl** US crude build sitting on crude imports of **7.3 mb/d** against a 6.3 four-week average, argued that barrels which could not reach Asia were being landed on the US Gulf Coast instead, and set an explicit test: whether imports stayed near 7.3 or reverted toward 6.3. **On the week ending 28 August — a week that PRECEDES this edition's window — they are 6.8 mb/d, which is exactly equidistant between 7.3 and 6.3 and therefore settles nothing on the level.** (!) What HAS moved decisively is the SPREAD to the four-week average, from **1.0 mb/d to 0.1** — though the four-week average itself ROSE from 6.3 to 6.7, which is the routing signal persisting in the slower series. Commercial crude DREW **4.5 mn bbl to 424.5 mn** on refinery utilisation of **98%**. The honest statement is that the dislocation is no longer visible in the weekly and that the test is INDETERMINATE on its own stated terms; it is re-set on the 10 September WPSR. A test set in public and then reported when it fails to resolve is the only kind worth setting. ¶ **SPR: 286.6 mn bbl** on the 28 August week, down **3.1 mn**, consistent with delivery against the 172 mn bbl US share of a coordinated 400 mn bbl release committed in March. (!) NO NEW SPR purchase, release or exchange was announced 6–9 September — **NOT FOUND**. The weekly draw is delivery against the March commitment and is not a new decision. ¶ **THE GLOBAL SIDE, from the last published official assessments:** on the August agency report, which is the newest published and is carried here UNREFRESHED (\$9.13): global observed oil inventories fell **69 mn bbl** in July to below 7.9 bn; Middle East outages of **8.3 mb/d** remained offline; world demand is forecast to **DECLINE 1.6 mb/d** in 2026; refinery throughputs of 80.9 mb/d in July sat nearly 5 mb/d below a year earlier. Every figure in this sentence is a July or August reading and none has been refreshed this cycle. The last official Hormuz flow estimate is **21.6 mb/d** pre-conflict against **4.9 mb/d** in Q2 2026 — **22.7%** of normal on the only single-basis official measure, and the nearest reading to the maritime downgrade's **25%** leg that exists. (!) It is a QUARTERLY figure and stale by a quarter, and it is carried into \$2.1 with that flag rather than left in the annex. (!) **THE 0.07 mb/d EFFECTIVE OPEC SPARE-CAPACITY FIGURE THIS DOCUMENT HAS CARRIED SINCE 14 AUGUST COULD NOT BE RE-CONFIRMED FROM A PRIMARY SOURCE THIS CYCLE.** It does not appear in the accessible August report summary, no September report exists yet, and the monthly OPEC publication returns an error to a fetcher. It is flagged as UNREFRESHED and is not repeated as current (\$9.13). ¶ **OPEC+ HELD OCTOBER OUTPUT UNCHANGED on 6 September.** The seven voluntary-adjustment countries decided to maintain September required production for October; the group next meets on **4 October**. Pre-meeting reporting says members must first review spare capacity before moving further, and that several are producing well below target despite having completed the 1.65 mb/d rollback. (!) No numeric spare-capacity estimate was published with the decision. A group that declines to add supply into a **\$95** Brent print because it must first audit its own capacity is telling the market something about the capacity, and that is an inference this document draws explicitly rather than smuggling.

A2.3.6 · The regional widening — what was struck, and what is not asserted about it

On **8 September** Houthi forces struck **Abha International Airport, King Khalid Air Base, and Saudi Aramco facilities at Abha and Jizan** — four sites, **73** wounded, with the energy ministry reporting fires at several locations and a temporary halt to some operations. The **Jizan refinery is a 400,000 b/d plant and had ALREADY been offline for several weeks after earlier attacks** — so the figure is capacity, not incremental lost supply, and the edition says so too. It was separately struck on 7 September, which is why the regional-relapse line is rewritten this edition to require a SUSTAINED widening rather than a single strike. It is described in TIER 1 reporting as the heaviest such attack in years and follows the collapse of a four-year truce. Saudi Arabia struck Taiz and Marib the same day, the coalition saying it would 'take all necessary measures and actions to respond to the sources of the threat'. Jizan had separately been attacked on **7 September**. ¶ (!) **WHAT IS NOT ASSERTED.** The US Secretary of State said on 8 September that the Iranian hand is behind it. That is a statement by a party to the conflict; it is recorded verbatim at A1.4a and is NOT treated as establishing Iranian direction of the attacks. The scenario line in \$5 turns on the fact of Gulf-state infrastructure being struck, which is not in dispute on any source, and not on the attribution, which is. (!) NO restart date for Jizan was published — **NOT FOUND** — and no barrel figure for the suspension is asserted. ¶ **Oman condemned the attacks on Saudi Arabia on 8 September.** That is recorded here because of what it establishes about the OTHER silence: the Omani foreign ministry published three items that day and commented on the region, so its silence on the strait arrangement is a choice rather than an artefact of a quiet ministry (\$9.23).

A2.3.7 · Corporate, industrial and the absences that are findings

ABSENCES, EACH WITH THE EXACT QUERY BEHIND IT (\$9.23c). No LSEG Hormuz transit count for any September date — **NOT FOUND**. No UKMTO or US-facilitated NCAGS TRANSIT count beyond JMIC 094's \$9/48h — UKMTO publishes incident counts, not transit counts. No war-risk premium quotation dated 6–9 September — **NOT FOUND**; the freshest attributable one is 22 July. No CENTCOM blockade tally for 8 September — **NOT FOUND**; a 9 September one would be **PROSPECTIVE**, exactly as the unposted 9 September AAA averages are, and the two are labelled on one rule. No Iranian crude export volume for 6–9 September — **NOT FOUND**. No Kharg TERMINAL status statement — the strikes were on tankers near Kharg and nothing is asserted about the terminal. No CENTCOM blockade tally for 8 or 9 September — **NOT FOUND**; the last is 94, as of the 7th. No September monthly OPEC report and no September IEA report — neither is published; **PROSPECTIVE**. No named Norwegian field outage for 7–9 September, though maintenance is cited generically in the gas commentary — **NOT FOUND**. No August CPI consensus — **NOT OBTAINED**. ¶ **AND ONE ABSENCE THAT IS THE MOST INFORMATIVE OF ALL.** No CONFLICT-TRACK item dated **9 September** was found — no CENTCOM release, no JMIC product, no Omani, Iranian or American statement. Every live news file checked terminates on 8 September. (!) The exception, stated so the claim is not overbroad: two market-pricing relays carry 9 September timestamps and are tabled at A2.3.3. **9 September is an OPEN, UNREPORTED DAY at the Singapore cut, and this edition says so rather than presenting the 8 September record as though it were current to the hour.** ¶ (!) A standing method note, and it is the reason this edition opens with a withdrawal: **a source's own index page can serve a stale cache.** The CENTCOM release index returned a listing topping out at 5 September on repeated fetches while an 8 September release existed and was reachable with an explicit page parameter. \$9.23 already held that a negative claim is a claim and must be checked against the SOURCE rather than against a note of it; this window adds that **an index is not the source either**, and that a negative built on one must be probed a second way before it is published.

A7 · SOURCE LOG

Tier 1 = primary or official. Tier 2 = reputable wire or press. Tier 3 = state media or relayed claim, corroborated against Tier 1 before it is used for anything market-moving. **NOT OBTAINED / NOT FOUND** = sought and missed, with the method named. **PROSPECTIVE** = relates to a session or publication that had not occurred at the Singapore cut, and is not a retrieval failure (\$9.46). Every 'used for' below was checked against what is actually published in the two documents; an entry that supports nothing published has been deleted.

Tier	Source	Used for
1 · DATA	Tecity Bloomberg extract, 'US Iran BBG Data.xlsx', saved and read 9 Sep. 182 rows × 99 columns, history from 31 Dec 2025; tickers read from the header scan, never hardcoded (\$3)	EVERY price, yield, spread, volatility and retail-fuel figure in both documents. The scoring reference is the 8 September close for every MARKET channel ; the two EVENT channels carry their own as-of dates, the first full close since 4 September. The 9 September row is a Singapore-morning mark and moves nothing. (!) No price is taken from the web. The extract's own row-1 description for AUTMUSAG — 'US Average Gasoline Price' — keeps the 'AAA all-grades' gloss withdrawn (A1.5)
1	US Central Command public release, 8 Sep. 'U.S. Destroys 5 IRGC Tankers After Iran Targets Another American Warship', read direct from centcom.mil with an explicit page parameter	THE ITEM THAT FORCES THIS EDITION'S CENTRAL WITHDRAWAL. Five named Iranian crude carriers destroyed — Kaviz, Charminar, Horizon 1 and Riesco in the Gulf of Oman, Derya near Kharg — after the IRGC targeted a US warship with ballistic missiles twice in two days; and Adm. Cooper's on-record framing of a deliberate economic cost. (!) METHOD, AND IT IS THE DEFECT: the release INDEX served a stale listing topping out at 5 September on repeated fetches. The 8 September item was reachable only with an explicit page parameter. The last edition's 'no CENTCOM release since 5 September' was read off that cache and was false

Tier	Source	Used for
1	US Central Command public release, 5 Sep, 'CENTCOM Destroys 3 IRGC Oil Tankers After Iran Targets 2 U.S. Navy Warships'	The prior exchange, retained for the SCALE comparison: three Iranian tankers on 5 September against five on the 8th, with Iranian ballistic missiles fired at US warships in both windows. Eight Iranian vessels destroyed across the two. (!) The '100 ships' blockade milestone that surfaces in search belongs to 23 MAY on a different counting basis and is NEVER joined to the 87/92/94 series
1	JMIC Update 094 primary PDF (ICOD 051500Z), published 6 Sep; ukmt.o.org product index and constructed product URLs for Updates 095, 096 and 097, probed direct 9 Sep	THE DENOMINATOR CORRECTION. 094's 101 is the CUMULATIVE CONFIRMED-INCIDENT count since 1 March, NOT a transit figure — the last edition called it a frozen transit count and that is CORRECTED . 094's transit figure is 59 vessels per 48 hours, 3–5 September, US-facilitated. Hormuz SEVERE , Gulf of Oman MODERATE. Also the central gap, and it is NOT OBTAINED rather than a claim of non-existence: three direct URL probes for update numbers 095–097 returned 404 and the JS-driven index renders no products, so 094 remains operative and does not record the 8 September American strikes either
1	UKMTO cumulative damage figure, relayed by wire 7 Sep	27 projectile-strike incidents resulting in vessel damage since 6 July. (!) A cumulative DAMAGE count with its own start date — never added to the 101, never converted into a rate, never compared with a transit figure
1	fm.gov.om homepage and English news archive, read direct 9 Sep , asked whether ANY item touches Hormuz, Iran, navigation, the corridor or mediation	THE CENTRAL NEGATIVE, AT ITS STRONGEST YET, WITH ITS QUERY STATED (\$9.23c). Answer: NONE. The ministry's most recent publications are dated 8 September and there are THREE of them — on Israeli settlement expansion, a Rwandan state visit, and a CONDEMNATION OF THE ATTACKS ON SAUDI ARABIA . So the ministry commented on the region that day and not on this. Footer: 'This website was last updated on September 8, 2026'. The most recent Omani text on the strait remains the 23 June joint statement, eleven weeks old. A silence from a live publisher is evidence; a silence from a dead page is not
2	Oman's foreign minister, signed newspaper article, reported 6 Sep	The ONLY Omani ministerial word in the window: no solution reached, Oman 'not walking away', the diplomat's task is to remain at the table. (!) Used as a HOLDING LINE and expressly not as an acknowledgement of the Iranian claim. It is the sole reason the mediated-pause line is held rather than cut
3	Iran: SNSC secretary Mohsen Rezaei, 7–8 Sep; MFA spokesman Esmail Baqaei, 7 Sep; Speaker Ghalibaf, 7–8 Sep; acting defence minister, 7 Sep — all via state media and relays	The announced EXCLUSION ZONE and its stated geometry from the American blockade line into the Gulf; the claim that corridor maps are agreed with Oman and will be signed within days; the claim that the understanding will be lodged with the IMO within days; and three days of verbal escalation. (!) Used as statements of IRANIAN INTENT only. \$9.11 gives announcements no weight in either direction. A second voice from the same government is NOT a second source (\$9.24). NO IMO filing is asserted: the one aggregator headline claiming it has happened is contradicted by its own body text. No coordinates have been published
1/2	Saudi Arabia, 8 Sep: energy-ministry statement and coalition statement, via wire; Aramco facility reporting	The four struck sites — Abha International Airport, King Khalid Air Base, Aramco Abha and Aramco Jizan — 73 wounded, fires at several locations and a temporary halt to some operations; the 400,000 b/d Jizan refinery; the Saudi strikes on Taiz and Marib in reply. (!) Used for the FACT of Gulf-state infrastructure struck, which no source disputes. NO restart date was published — NOT FOUND
1	US Secretary of State, 8 Sep; US Treasury Secretary, 8 Sep; US President, 7 Sep	The administration's standing rejection of any Iran–Oman corridor and its objection to transit fees (TIER 2 relay, 7 Sep) — the only sourced US statement on the corridor, and the basis for the 'pre-rejected by the third party' framing. The 'Iranian hand' attribution for the Saudi attacks — recorded verbatim and expressly NOT treated as establishing Iranian direction; the threat to cut counterparties of Iranian AIRLINES — not the corridor — off from the financial system; and the presidential claim that oil falls to \$3 and then under \$2 a gallon on a US win. (!) The last is a POLITICAL forecast and is used only to date the administration's public framing of fuel prices
1 / 2 / 3	Kpler via wire 7 Sep (TIER 1); Windward MIOC 6 Sep (TIER 2); Lloyd's List Intelligence (TIER 2); IMF PortWatch via aggregator, 30 Aug (TIER 3, unrefreshed). (!) Tiers are carried per provider and NOT lumped	The FIVE provider readings at A1.4, each with its own universe and baseline and NEVER spliced (\$9.19, \$9.24). (!) Kpler's 15+, 13 and 10 across 4–6 September are three published readings and NO rate of change is computed across them. Windward's 12 and Kpler's 6 for the SAME day are a definitional artefact, not a discrepancy. NOT FOUND: any LSEG transit count for September, and any provider reading for 7, 8 or 9 September
1	fiscaldata.treasury.gov auctions endpoint (the standing method under \$9.39a), queried 9 Sep; Treasury press release of 19 Aug; the Tentative Buyback Schedule; Treasury buyback operations data	The \$58bn 3-year of 8 September: clearing yield 4.474% , bid-to-cover 2.72 , SOMA nil, and the allotment on BOTH denominators (A2.3.4). The \$39bn 10-year and \$22bn 30-year as PROSPECTIVE . The 8 September bill auctions and their SOMA add-ons. (!) THE BUYBACK CONFLICT, SOURCED ON BOTH SIDES: the release says 'at least \$4bn ' effective 9 September, the schedule still says \$2bn for the 10th, and the promised updated schedule is unpublished. No size is asserted. NO TAIL IS ASSERTED and none can be (\$9.39)
1	gasprices.aaa.com, including its Highest Recorded Average Price table, read direct 9 Sep; EIA retail and weekly petroleum pages, read direct	AAA regular \$4.1514 and diesel \$5.9012 for 8 September, and the finding that the diesel record run ENDED: the all-time record stands at \$5.9015 of 7 September and the 8th printed three hundredths of a cent below it. AAA's all-time REGULAR record of \$5.0165 , 14 June 2022 — which forces the correction that \$5.18 belongs to AUTMUSAG and not to AAA. EIA on-highway diesel \$5.599 against an EIA high of \$5.810 . (!) The 9 September AAA averages had NOT posted at the cut on two direct fetches: PROSPECTIVE
1	EIA Weekly Petroleum Status Report for the week ending 28 Aug (released 2 Sep), read direct; EIA STEO landing page and WPSR schedule, read direct 9 Sep	THE \$9.28 TEST ANSWER: crude –4.5 mn bbl to 424.5 mn , imports 6.8 mb/d against a four-week average of 6.7 , utilisation 98% ; distillate 104.2 mn bbl and PADD 1 distillate at 19.318 mn bbl ; SPR 286.6 mn bbl , –3.1 mn . And the schedule: the retail print and the September STEO due 9 September, the WPSR pushed to 10 September at 12:00 and 14:00 ET. None had published at the cut: PROSPECTIVE
1	OPEC press release, 6 Sep, read direct	October production held at September levels by the seven voluntary-adjustment countries; next meeting 4 October . (!) NO numeric spare-capacity estimate was published with it , and the 0.07 mb/d effective-spare figure carried since 14 August could NOT be re-confirmed from any primary source this cycle — the monthly OPEC report returns an error to a fetcher and no September IEA report exists. Flagged UNREFRESHED, not repeated as current (\$9.13)
1	Federal Reserve FOMC calendar and September blackout dates; BLS release schedule; a governor's 3 Sep speech text	The CONFIRMED ABSENCE of any Fed speech 4–9 September; the FOMC on 15–16 September with projections; PPI on the 10th and CPI on the 11th at 08:30 ET, both inside the blackout. The 3 September remarks that energy pass-through 'hasn't come to pass, at least so far' and that the governor's vote turns on August inflation. (!) NO August CPI consensus could be sourced — NOT OBTAINED , and a consensus this document cannot name is not quoted

Tier	Source	Used for
1/2/3	Five separate rate-pricing venues, each dated and each recorded at A2.3.3	The SIGN of September pricing and nothing finer. (!) The venues use different contracts, methods and timestamps and are NOT averaged, chained or joined; the two freshest same-day readings disagree by about five points. The WITHDRAWAL of the 48.4% → 58.4% pair STANDS, and so does the withdrawal of any DIRECTION. What survives is that no venue prices a cut
—	NOT FOUND / NOT OBTAINED — the consolidated register	Any item of any kind dated 9 September on any track, every live news file terminating on the 8th — 9 September is an open, unreported day at the cut. JMIC 095. A CENTCOM blockade tally for 8 or 9 September. Any LSEG Hormuz transit count for September. Any UKMTO or NCAGS transit count beyond 094's 59/48h. A war-risk quotation dated 6–9 September. Iranian crude export volumes for 6–9 September. Kharg terminal status. A Jizan restart date. A named Norwegian field outage. An August CPI consensus. A re-confirmable OPEC spare-capacity figure. (!) Robots-blocked or 403 to a fetcher and therefore NOT usable as sources here: several major broadcasters, the specialist marine-insurance press, and one business title

A8 · ON-DEMAND UPDATE PROTOCOL

#	Step	Detail
1	Refresh and verify the extract	Never build an edition off a stale extract (\$9.22). Check the file mtime AND parse the sheet. This edition: the extract was saved on 9 September and carries a 9 September row against the 8 September row the last edition ran on, with the 8 September row now fully settled. It is fresh. (!) The refresh is NOT complete, and the incompleteness is the finding: the three cells \$9.60 recorded as LOST for 7 September are STILL blank, so the loss is permanent.
2	Parse with a dynamic header scan	Column indices move between uploads. Auto-detect the Brent and WTI front month and take whatever label the header scan returns for DXY. Re-verify the 27 February anchor field by field — done this edition, unchanged on all SEVENTEEN scored fields, which A10.1 tables alongside three unverified rows it marks as such. (!) Read the DESCRIPTION row, not just the ticker row: doing so is what exposed that AUTMUSAG is labelled 'US Average Gasoline Price' and not 'AAA all-grades' (A1.5, \$9.57). A ticker map is not a definition.
3	Run all THREE integrity checks	Row-level (\$9.8), field-level identical-value at the precision each series is published to (\$9.35, \$9.48), and the continuation-versus-active BASIS check (\$9.41). This edition: \$9.41 CLEARs ; \$9.8 CLEARs — the 8 September row refreshed and carries thirteen values the row before it did not have; \$9.35 CLEARs ON THE 8 SEPTEMBER ROW ENTIRELY and FIRES on the 9 September row on ONE field, the five-year at 4.5627, an exact four-decimal repeat in a live row. (!) The field it fires on is the one carrying a new WAR HIGH — which sits on the resolved CLOSE, not on the repeated mark, so the rule costs nothing here and protects everything.
4	Run the backfill check in BOTH directions	\$9.10: yesterday's dark cells must be re-examined, not carried, and a backfill is as likely to run against a trend as with it. (!) THIS EDITION IT FIRED ON NOTHING, AND THAT IS THE FINDING. The three cells \$9.60 recorded as LOST — WTI CL2 88.96, CLA 91.95 and Henry Hub 2.929 for 7 September — are STILL blank in this extract, so the two-way test has now been run on them and returned nothing: the loss is permanent rather than transient. AUTMUSAG did not backfill either and is unresolved for a third session. A test that fires on nothing after firing upward in five consecutive editions is worth stating, because the absence is what stops a trend being read through the gap (\$9.30).
5	Compute deltas and test every trigger	d/d, w/w five rows back, and versus pre-war; explicit trigger tests for the four market channels plus Stage-4 A, B and C. Run min, max and last-prior-occurrence on the full column before writing ANY superlative (\$9.32). This edition that discipline produced the five-year WAR HIGH at 4.5627, which no narrative anticipated; established that TTF's €75.841 is the FIFTEENTH war-record close and the first above €75; established that 62 cents is the nearest the scored Brent series has closed to its trigger since 24 July; and — the correction — that Asia LNG's ¥4,010 was the TWELFTH war-record close and not the thirteenth this document published.
6	Verify the news, and re-verify what was inherited	Every claim needs a named source and an exact date, and negative claims decay fastest of all (\$9.23). State the exact query behind every negative. Say NOT OBTAINED rather than estimating, and distinguish it from PROSPECTIVE (\$9.46). (!) This edition the discipline paid in the other direction: the last edition's 'no sanctions landed' and 'tanker for tanker is one anonymous chain' were both true at their cut and both were overtaken within hours, so they are SUPERSEDED rather than withdrawn. A negative that expires is not a negative that was wrong, and the two are recorded differently.
7	Build, then QA in three passes	A numeric harness against the dataframe; a STYLE harness measuring bold ratio and headline length (\$9.52, \$9.55); an adversarial PROSE pass by reviewers with no access to the source data, run as TWO reviewers CONCURRENTLY against the same pre-fix text and merged into one patch (\$9.42); and a VISUAL render, which is not optional (\$9.43). Re-run the numeric and style harnesses AFTER the prose fixes. Balance the bold tags in every fragment after every edit (\$9.42a). Check the page budget at build time, not after the prose is final (\$5A).
8	Deliver both documents	The edition and the annex go into the project root together. A file that is not committed never reaches the reader. The annex does not go into the dashboard PDF folder, because the score-history script regexes a score sentence out of every PDF there and the annex has none. Then snapshot the fragments under a date-stamped name, at the END of the run, so no edition can overwrite another's sources.

A9 · METHODOLOGY

Six channels, each scored 0–5, summed to 0–30. Bands: 0–7 watch; 8–14 stress; 15–21 systemic-risk watch; 22–30 crisis. Maritime denial and escalation risk are event channels; oil, US inflation impulse, Treasury stress and political stress are market channels scored on confirmed closes.

(a) Confirmed closes only for market channels. No market channel moves on an intraday print. **THAT RULE IS DOING MORE WORK THIS EDITION THAN IN ANY EDITION OF THIS WAR.** The 9 September mark on the SCORED Brent series is **\$95.61, 61 cents THROUGH** the upgrade level; it moves nothing, and a TTF mark of €76.770 above the new war-record close is likewise not reported as a record. (!) The discipline was tested in this exact window and paid TWICE. On 7 September a TTF mark above the record settled €1.549 LOWER. And on 8 September the reverse: the snapshot published here read **\$93.32** against a close of **\$94.38**, a **\$1.06** miss, which is **1.7 times** the entire remaining distance to the oil trigger — a cut that can be a dollar wrong in either direction cannot adjudicate a 62-cent question. (b) Hysteresis. Upgrades fire on a sustained break; downgrades require a sustained reversal past a wider threshold. It was vindicated again this session: the

Treasury downgrade's volatility leg, satisfied on exactly TWO closes, LAPSED on the third available one at 76.14 — a **SIXTH** satisfied-then-given-back sequence — and had this document converted two dark sessions into a third satisfied close, as §9.9 forbids, it would have been wrong within one print. On the other side the 5y5y forward took a **FIFTH** close above its **2.30%** firing level, clearing by **1.19 bp**, and the downgrade rule sitting **16.99 bp** lower is still NOT rewritten to meet it (§9.16, §9.26). (c) The scale saturates in BOTH directions (§9.7, §9.27). FIVE of six channels are at the cap, so the score could not register eight Iranian vessels destroyed in two navy-on-navy exchanges in four days, Iranian ballistic missiles fired at American warships in both, the heaviest Houthi attack on Saudi Arabia in years taking four sites and a 400,000 b/d refinery, or a mediator that published three separate items on 8 September without mentioning the strait. Nor could it register what cut the other way — an eighth day with no acknowledged American strike on Iranian soil, and a 3-year auction absorbed with a dealer take under **11%**. A flat 27 is an instrument at its stop.

Rules exercised this edition, named so the reader can audit them. (!) A §9.x reference points to the numbered pitfalls register in this monitor's operating instructions, not to a subsection of A9; the substance of every rule doing work in this edition is restated in the paragraph that invokes it, so the edition stands alone without the register. §9.41 **CLEARs**; §9.8 **CLEARs**; §9.35 fires on ONE field, the five-year mark, and the record it guards sits safely on the resolved close (A1.1). §9.9 — **VINDICATED**: the refusal to convert two dark MOVE sessions into a third satisfied close was right, because the print that ended the silence was **76.14** and LAPSED the leg. §9.10 — the two-way backfill test fired on NOTHING, confirming the §9.60 losses as permanent. **§9.11 — an announcement is not an event: three days of Iranian verbal escalation moved neither the escalation channel nor any scenario line, while the CENTCOM strike and the Saudi attacks, which ARE events, moved two. (!) Bound the first half honestly: the channel is at its cap and could not have risen in any case, so what §9.11 actually prevented was the words entering the SCENARIO map, which is where they would have done damage. §9.13 — the rule that produced this edition's central work: re-verification of INHERITED claims yielded two withdrawals and three corrections, none of them from news. §9.15 — both Treasury legs computed and compared; this session neither rotated, both moved away. §9.19 and §9.24 — every denominator named, none spliced: JMIC's incident count against its transit count, Kpler's visible-commodity universe against Windward's AIS-transmitting cargo-and-tanker universe for the SAME day, Lloyd's List's 10,000 dwt gate, PortWatch's 85/day base, FIVE retail fuel series, TWO auction-allotment denominators and FIVE rate-pricing venues. §9.23 — the central negative, at its strongest yet AND the source of the central withdrawal. On the positive side: fm.gov.om is demonstrably live, its footer reads last updated 8 September and it published THREE items that day including a condemnation of the attacks on Saudi Arabia, so its silence on the strait is a choice. On the negative side: the CENTCOM release INDEX served a stale cache and this document read it as the source. §9.26 — engaged on two channels at once: on oil, forbidding resolution of §9.56 toward whichever Brent series would fire the upgrade, with the mark now through the level; on inflation, forbidding the reverse move of tightening the rule as the margin thins. §9.30 — the scored gasoline series is unresolved for a third session and no trend is read through the gap. §9.31 — the snapshot missed the US session in ONE direction across eleven of fourteen reconciled fields, and the reconciliation publishes its three exclusions by name. §9.32 — every superlative bounded against the full column BEFORE writing, which is what produced the five-year war high and the Asia LNG ordinal correction. §9.37 — a field published as unresolved yields NO reconciliation entry, which is why BE10 is excluded by name despite having settled. §9.48 — the identical-value test stated at the precision it is being run at, on a two-decimal retail series where it discriminates weakly. §9.57 and §9.61 — the political channel's scope question restated and left open.**

§9.56 — **THE LEVEL IS NOW STRADDLED BY 62 CENTS ON ONE SIDE AND 61 ON THE OTHER, AND A DECISION IS ONE CLOSE AWAY**. A trigger written on a continuation series stops being well-defined the moment the basis opens, and the failure is silent. The oil channel's upgrade is 'Brent above **\$95** sustained'. That rule was written and applied through long stretches in which CO2 and COA printed the SAME NUMBER — exactly zero basis for twenty consecutive sessions to 28 August. Brent rolled on 31 August and the basis has run 2.12, 3.08, 3.54, 3.89, 3.96, 3.84 and 3.54 on closes, with the 9 September MARK at 3.90 — the mark is labelled and not spliced into the close series. (!) The 2.12 is the roll step itself and is not read as a market move. On the 8 September close the trigger falls BETWEEN the two series for a **FIFTH** consecutive session: the scored continuation **62 cents** below it, the active contract **\$2.92** above it. 'Sustained' has a settled operational meaning here — two consecutive confirmed closes, the test that fired US-inflation 4→5 on 31 July and cut oil 2→1 on 3 July. The active contract has now closed above **\$95** FIVE times in succession, so on that series the condition has been met in full since 3 September. (!) **WHAT IS MATERIALLY NEW IS THAT THE SCORED SERIES IS NO LONGER FAR AWAY**. Its gap has run **\$3.37, \$2.68, \$1.84, \$0.62** across four closes — **82%** closed — and is now **SMALLER** than this series' own largest daily move within that run. The 9 September mark is **\$95.61**, through the level. **The hold rests on nothing except which of two rising series the rule happens to be written on, and this document says so plainly rather than dressing it up. Three things follow and all three remain the practice.** (a) The channel is held on the scored continuation, and the alternative reading is published in the EDITION rather than buried here, because a reader checking a screen quote for 'Brent' will find the active contract. (b) The rule is NOT moved to whichever series would fire it — the §9.26 discipline — and there is an **AFFIRMATIVE** reason as well: the **\$95** upgrade, the **\$72.48** downgrade and the pre-war anchor are ALL written on the continuation, so moving one alone would make the channel incoherent in the other direction. (c) The problem was disclosed on 2 September, BEFORE the level was straddled, and is not being decided now under the pressure of a fired trigger, which is the §9.16 precedent. (!) **THE PRACTICAL CONSEQUENCE, STATED IN ADVANCE SO IT CANNOT BE CHOSEN AFTER THE FACT: two CO2 closes above \$95 fire the upgrade 2→3 and take the score to 28. One close does not.** (!) With ONE documented exception, which this document raises against itself: the continuation closed above **\$95** on 23 and 24 July and no upgrade fired, because the ACTIVE contract was below the level on both days (§9.36). That escape does not recur here, since both series are above or at the level together — but the rule as applied has always carried it, and it is stated now rather than discovered later.

§9.51 — **CARRIED FORWARD, AND THE OBSERVATION COUNT ADVANCES TO SEVEN**. When a defective test keeps returning the same answer, the defect is the finding. Threshold B has now been satisfied on SEVEN consecutive closes on ONE arming — 28 and 31 August, 1, 2, 3, 4 and 8 September, 7 September producing no close at all — and across those seven the curve has taken **THREE of the four configurations available to it**: bear flattener, bear steepener and bull steepener. Only a bull flattener has never occurred under the current arming. **A test written to detect long-end stress has returned ARMED through all three, which means it is discriminating between curve regimes not at all.** (!) **THE PREVIOUS EDITION'S OBSERVATION IS SUPERSEDED AND IS WITHDRAWN RATHER THAN LEFT STANDING**: it recorded the two legs DIVERGING, the 30-year margin narrowing a third consecutive close to **4.23 bp** while the 10-year's widened to **13.21**. On the 8 September close BOTH legs widened — 30-year to **4.54 bp**, ending the three narrowings, and 10-year to **13.82** — so the divergence lasted one observation and the sentence that called it new must not be carried a second time. That is the whole of §9.13 applied to this document's own analysis rather than to a news claim: **a paragraph inherited from the last edition is exactly as suspect as a figure inherited from it, and this one had to be rewritten rather than re-run**. The open question is unchanged and is NOT

decided here: whether B should test the long end's LEVEL, as written, or its CONTRIBUTION to the curve, which is what a stress test is presumably for.

\$9.57 — CARRIED FORWARD, **UNRESOLVED**, AND IT FAILED IN A NEW PLACE THIS WINDOW. **A TICKER MAP IS NOT A DEFINITION, AND A SERIES DESCRIPTION IS AN INHERITED CLAIM LIKE ANY OTHER.** This document captioned AUTMUSAG as 'AAA all-grades retail pump' for months and scores an entire channel on it against a **\$3.52** anchor and a **\$4.75** trigger; the extract's own description row says only 'US Average Gasoline Price'. (!) **THE NEW FAILURE: the last edition printed AAA's gasoline record and AUTMUSAG's own \$5.18 peak in adjacent sentences.** They are different series and neither is evidence about the other — **CORRECTED** here, with both distances now stated separately: AUTMUSAG at **\$4.93** is **4.83%** below its own war high, AAA regular at **\$4.1514** is **17.2%** below its **\$5.0165** record of 14 June 2022. The four rules stand. (a) Re-verify a series DESCRIPTION on the same schedule as an inherited news claim (\$9.13, \$9.23). (b) The failure of a description does NOT impugn the series — AUTMUSAG is continuous, pre-dates the war, and has a stable structural spread to the DOE regular series, recomputed this edition at a war-long mean of **67.3c** in a range of 60.3c to 75.9c across 27 dates where BOTH resolved. (c) DO NOT RE-BASE A SCORED SERIES ON THE EDITION THAT DISCOVERS ITS LABEL IS WRONG (\$9.21, \$9.56b). (d) Publish the irreconcilable numbers side by side with their denominators named (\$9.19) and keep the reconciliation open. (!) It could NOT be advanced this edition: the DOE corroboration series is dark for a second week and its delayed release, due 9 September, had not published at the cut. (!) A FIFTH series is on the record and is not spliced into any of the other four: EIA's on-highway diesel read **\$5.599** for 31 August against an EIA all-time high of **\$5.810**, so on the EIA survey the diesel record has still NOT been taken while on AAA's it was taken three times in four days and then MISSED by three hundredths of a cent on the fourth.

\$9.58 — APPLIED AND NOW SPENT. **A KNOWN AND BENIGN CAUSE DOES NOT EARN AN EXEMPTION FROM AN INTEGRITY RULE.** On the 7 September row six rate fields, the 2s10s, the dollar index and AUTMUSAG were identical to four decimal places to their 4 September closes, and the cause was not mysterious: US markets were shut for Labor Day. The tempting move is to say the check has not really fired — that a holiday carry is a different object from a vendor failing to write a value — and to report the fields as unchanged rather than unresolved. That move was refused, and the reason is that \$9.35 exists precisely because a carry and a genuine unchanged print are INDISTINGUISHABLE IN THE CELL. (!) **THE REFUSAL WAS VINDICATED WITHIN ONE SESSION.** BE10 was reported unresolved on both rows; it settled at **2.3751%** on 8 September, up **2.19 bp** and its highest close since 4 June. Had the repeat been published as a reading, this edition would be reporting a flat breakeven on a session it rose more than two basis points — the 17 August failure exactly, in which a confident explanation of an identical 30-year print concealed a new **war high**. Three rules stand. (a) Apply the remedy on the cell's evidence, not on the analyst's theory of the cell — unresolved, no d/d, no reconciliation entry (\$9.37). (b) Publish the cause anyway, because a reader is owed the difference between a market that is shut and an extract that has failed, and because it tells the reader something useful: there was NO 7 September close for those fields at all, and this edition's comparisons therefore run 4→8 September. (c) Extend the treatment to any field on the same row whose settlement depends on the same closed market, even where the value DID move. The cost of under-claiming for one session is nothing; the cost of over-claiming is a published record.

\$9.60 — NEW. A ROW CAN LOSE DATA IT ALREADY HELD, AND NEITHER STANDING ROW-LEVEL RULE ANTICIPATED IT. \$9.8 tests whether the prior row FAILED TO REFRESH. \$9.10 tests whether a dark cell is later **BACKFILLED**. Both assume the information content of a row is non-decreasing. On 8 September it decreased: WTI CL2 at 88.96, CLA at 91.95 and Henry Hub at 2.929 were all published as 7 September marks in the last edition, from the extract, and all three cells are BLANK in the next one — and STILL BLANK in the one after, so \$9.10's two-way backfill test has now been run on them and returned nothing: the loss is PERMANENT, not transient — while, on the same row, Brent settled, TTF settled, Asia LNG arrived into a blank cell and the whole rate block carried. A row can therefore settle, carry and REGRESS simultaneously, and a single verdict on the row is meaningless. Four rules. (a) Diff the prior row against the last edition's PUBLISHED figures FIELD BY FIELD, not row by row, and record three outcomes rather than two: settled, carried, **LOST**. (b) A lost cell yields NO close. No day-on-day change may be asserted for it, and the next comparison skips a session — here 4→8 September for those three, which is arithmetically the same treatment the holiday forces on the rate block but for an entirely different reason, and the two causes must not be merged in the prose. (c) A lost cell yields NO reconciliation entry either, because a reconciliation gap is a published mark minus a settled close and there is no settled close — \$9.37 extended to a third case, alongside carries and restatements. (d) Say that the values existed and are gone, not that they were never there. The published mark is part of this document's record; a reader who compared the two editions would otherwise conclude that this one had simply omitted them. (!) The general form: an integrity rule written for a failure mode you have seen will not fire on one you have not, so state what each rule ACTUALLY tests, and treat a row as a set of independent cells rather than as an object with a single state. That is the same lesson \$9.35 taught about field-liveness, arriving from the opposite direction.

Restatements and comparability. Vendor restatements are normal and make absolute levels non-comparable across editions, though directional analysis is continuous. A contract roll does the same thing to a continuation series silently, which is why the basis check is a standing check. The dual gasoline series is never re-based: AUTMUSAG is the scored reference and preserves the **\$3.52** anchor and the **\$4.75** trigger; USRFRUSA is corroboration only; AAA's published headline is a third series and is never compared with either. The pre-war anchor is the 27 February 2026 close, re-verified field by field every edition; it is unchanged to date. **FOUR OPEN ITEMS REMAIN DISCLOSED RATHER THAN DECIDED.** (1) FIRST IN LINE AND NOW AT THE POINT OF DECISION: \$9.56, the oil trigger's ambiguity across the roll — **62 cents** below on the scored series and **\$2.92** through on the active one, with FIVE consecutive closes through on the active series and a 9 September mark through it on the scored one. Two CO2 closes settle it. (2) Threshold B's long-end LEVEL versus long-end CONTRIBUTION question, per \$9.49 and \$9.51, now SEVEN observations deep and spanning FOUR distinct curve shapes — a test meant to detect long-end stress has returned the same answer through every configuration available to it. (3) \$9.57 and \$9.61, the scored gasoline series' reconciliation and the political channel's GASOLINE-versus-DISTILLATE scope question, both open and neither advanceable this edition. (4) The US-inflation channel's firing-versus-downgrade gap: the firing trigger has now held FIVE closes with the latest clearing by **1.19 bp** while the downgrade sits **16.99 bp** lower. The oil channel's own separate asymmetry stands unchanged: its downgrade is written as a mediated pause AND a close at or below **\$72.48** while its upgrade requires a SUSTAINED break, which as written makes the downgrade's PRICE limb easier to trip than the upgrade's, though the downgrade also requires a mediated pause and is not therefore the easier test overall. It is **\$21.90** away and not live.

A10 · ANCHOR AND TRIGGER LEVELS

A10.1 · Pre-war anchor — 27 February 2026 close; the seventeen scored fields re-verified this edition field by field, unchanged

Series	Anchor	8 Sep close	Change	Series	Anchor	8 Sep close	Change
Brent CO2	72.48	94.38	+30.2%	2s10s	55.64	39.252	-16.39 bp
Brent COA	70.88	97.92	+38.2%	10y breakeven	2.2569	2.3751	+11.82 bp
WTI CL2	67.02	90.19	+34.6%	5y5y forward	2.142	2.3119	+16.99 bp
Henry Hub	3.063	2.916	-4.80%	MOVE	73.38	76.14	+2.76
Dutch TTF	31.227	75.841	+142.9%	VIX	19.86	15.72	-4.14
Asia LNG	1,669	3,975	+138.2%	Dollar index	97.608	98.787	+1.18
2-year	3.3749	4.3936	+101.87 bp	SOFR	3.68	3.65 (4 Sep)	-0.03
5-year	3.5017	4.5627	+106.10 bp	Gasoline, scored	3.52	4.93 (4 Sep)	+1.41
10-year	3.9375	4.7882	+85.07 bp	Gasoline, DOE	-2.94	4.071 (31 Aug)	+1.13
20-year	4.5505	5.2521	+70.16 bp				
30-year	4.6106	5.2454	+63.48 bp				

The SEVENTEEN scored anchors were re-verified field by field against this extract and NO restatement was found in the last ten rows. (!) Three rows in this table sit OUTSIDE that verified set and are marked as such: Brent COA (70.88), SOFR (3.68) and the DOE gasoline base (-2.94), the last being approximate and dated 23 February rather than the 27th, so the +1.13 change it carries is approximate too. (!) THREE cells carry an older as-of date because the series is unresolved or weekly, and each is labelled in place rather than silently forward-filled: SOFR and the scored gasoline series to 4 September, the DOE series to 31 August. (!) Absolute levels are not comparable with pre-restatement editions; directional analysis is continuous (§3).

A10.2 · Live trigger state — every channel on the 8 September close, with events to 9 September

Channel	Score	Upgrade condition and live distance	Downgrade condition and live distance
1 · Maritime denial	5	AT THE CAP. Further deterioration cannot raise the score	A VERIFIED REOPENING and traffic above 25% of normal for TEN sessions. (!) NEITHER LEG IS CLOSE, and 'normal' has no single denominator: on Kpler's pre-war ~130-140/day its own 6 September reading of 6 is under 5% ; on PortWatch's 85/day the same week reads 7% . No reopening of any kind is claimed by any party
2 · Oil price shock	2	Brent above \$95 sustained → 3. On the SCORED CO2 continuation the 8 September close of \$94.38 is 62 CENTS BELOW , from \$1.84 , \$2.68 and \$3.37 on the three prior closes. (!) On the ACTIVE contract the condition is SATISFIED and has been on FIVE consecutive closes since 3 September. (!) The 9 September MARK on the scored series is \$95.61 , 61 cents ABOVE , and settles nothing. TWO CO2 closes above \$95 fire this channel and take the score to 28	A mediated pause and a close at or below the \$72.48 anchor → 1. \$21.90 away on price, and the pause leg has no candidate at all
3 · US inflation impulse	5	AT THE CAP	5y5y sustained at or below the 2.142% anchor → 4. 16.99 bp away. (!) The FIRING level of 2.30% is a different and much nearer line: the 8 September close of 2.3119% clears it by 1.19 bp , a FIFTH close above it, the five clearing by 1.10, 0.96, 1.54, 0.82 and 1.19 bp. The rule has NOT been moved to match the trigger (§9.16, §9.26)
4 · Treasury stress	5	AT THE CAP	30-year below 5.00% WITH MOVE below 75 , sustained → 4. (!) THE VOLATILITY LEG HAS LAPSED : MOVE resolved at 76.14 after two dark rows and fails by 1.14 after exactly TWO sub-75 closes — a SIXTH satisfied-then-given-back sequence in this war. The yield leg fails by 24.54 bp and has not closed below 5.00% since 6 July. BOTH legs moved away this session , so §9.15's rotation does not apply
5 · Political stress	5	AT THE CAP	THREE consecutive AUTMUSAG closes at or below \$4.60 with no intervening print above \$4.70 → 4. Last resolved \$4.93 (4 Sep), 33 CENTS above, and UNRESOLVED ON THE THREE ROWS SINCE (7, 8 and 9 September). The earliest possible move is at least three prints away. (!) A further fall toward the \$3.52 anchor would be needed for 3
6 · Escalation risk	5	AT THE CAP	A mediated stand-down with talks resumed → 4 or 3. NO talks, venue, round or date exists. (!) The window ran the other way: five Iranian tankers CLAIMED destroyed by CENTCOM on 8 September after ballistic missiles at a US warship, and four Saudi sites struck the same day

A10.3 · Stage-4 thresholds — levels and live margins

	Written test	State on the 8 September close	Margin
A	A failed coupon auction: a clearing yield with a tail above the 1pm when-issued level	UNTESTABLE AS WRITTEN. Treasury publishes no when-issued level, so the test cannot discriminate between states and returns NONE. (!) It is neither armed nor not-armed (\$9.39). The \$58bn 3-year of 8 September cleared at 4.474% , bid-to-cover 2.72 , dealers 10.91% on competitive-accepted — read the composition, not a tail	No margin exists
B	30-year above 5.20% WITH 10-year above 4.65%	ARMED , and the run EXTENDS to a SEVENTH close on ONE arming, 28 August to 8 September, 7 September producing no close. Six armings and five lapses since 29 July — eleven states, ten changes. (!) \$9.49 is now WORSE : seven closes spanning FOUR distinct curve shapes, a clean bear FLATTENER having joined the bear flattener, bear steepener and bull steepener already recorded	30Y clears by 4.54 bp (from 4.23, ENDING three narrowings); 10Y clears by 13.82 bp (from 13.21). Both legs widened
C	MOVE above 130	NOT ARMED , and RESOLVED after two dark rows at 76.14 . (!) The two anchor deviations are reported SEPARATELY and no composite is built: volatility is 2.76 points ABOVE its 73.38 anchor, having been below it, and the 30-year 63.48 bp above its own. The war's standing anomaly has weakened on the volatility side for the first time since 28 August	53.86 points below C; 38.88 below the 115.02 war high of 26 March

Hysteresis governs every line above (\$4b). An upgrade needs a sustained break; a downgrade needs a sustained reversal past a **WIDER** threshold. That asymmetry has been vindicated repeatedly and in both directions — three times in the fortnight to 14 August, and again this edition, where a volatility leg satisfied on two closes lapsed on the third available one. (!) Bound it properly: the Treasury downgrade is **CONJUNCTIVE** and its yield leg has failed since 6 July, so the **SCORE** was invariant to the volatility call. What hysteresis protected was the leg-level statement. (!) **Scale-cap framing: five of six channels are at the ceiling, so further geopolitical deterioration CANNOT raise the score. Only the oil channel has headroom, and it is 62 cents from using it.**
